III.7. Intermodal transportation specific barriers

III.8. Political situation

III.9. Mismatch of public and private interests

IV. EATL: LOOKING INTO THE FUTURE

V. CONCLUSIONS AND RECOMMENDATIONS

REFERENCES

INTRODUCTION

History and background

The Euro-Asian Transport Links (EATL) project is a part of long-term collaborative work carried out during recent decades by international institutions and particular countries of the Eurasia to improve the conditions for trade and socio-economic development on the continent.

At the moment EATL is supported by 38 countries: Afghanistan, Armenia, Azerbaijan, Belarus, Belgium, Bosnia and Herzegovina, Bulgaria, China, Croatia, Cyprus, Finland, France, Georgia, Germany, Greece, Iran, Italy, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Luxembourg, Malta, Mongolia, Pakistan, Poland, Portugal, Republic of Moldova, Romania, Russian Federation, Serbia, Spain, Tajikistan, The former Yugoslav Republic of Macedonia, Turkey, Turkmenistan, Ukraine, Uzbekistan.

EATL started in 2002 as a joint undertaking between the United Nations Economic Commission for Europe (UNECE) and the United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP).

Phase I of the project (2002-07) had selected the main Euro-Asian road, rail and inland water transport routes, transshipment points and ports. Projects were prioritized in order to improve the selected routes. The first analysis of physical and non-physical obstacles hampering the trade via the surface Euro-Asian routes was undertaken. An Expert Group established under the Phase I proved to be the effective cooperation platform for the coordinated development of coherent Euro-Asian inland transport links.

Phase II of the EATL project (2008 to 2013) was coordinated by UNECE. Within this phase the Expert Group identified nine rail and nine road corridors (EATL corridors) which should be considered as principle transport links between Europe and Asia. At the same time 311 projects linked with the EATL corridors were proposed by the participating countries. The projects have been evaluated from the standpoint of their relevance and importance for international traffic and their value to connect Asia and Europe. The assessment of transport investment needs along EATL routes at the multi-country level was undertaken which formed the basis of the updated EATL Investment Plan. Administrative impediments to transport and trade were also identified.

Among the most valuable Phase II results the following should be noted:

- analysis of the Euro-Asian railway links in comparison to maritime transport that could be used as anchors for further railway reforms to improve railway services for trade within the continent;
- comparison of nine door-to-door transport scenarios: time-wise and cost-wise. In five out of the nine scenarios, rail transport performs better than maritime for both the cost and time. In all nine scenarios, rail transport performs better than the maritime in terms of time;
- the transport and border-crossing facilitation review and analysis that offers concrete examples and highlights certain specific issues to be addressed;
- SWOT analysis of the EATL corridors.

Finally, the Phase II report lists a number of recommendations in the areas of infrastructure development, facilitation and sectorial policies. The Study argues that well-functioning EATL corridors, efficient customs transit regimes, the implementation of international trade and

transport conventions, elimination of rent-seeking as well as the overall improvement of transport and logistics services can shorten the economic distances between EATL countries.

Within Phase II UNECE also created and made freely available the Geographical Information System (GIS) interactive application that gives access to the database related to the EATL corridors. UNECE is ready to maintain this database in collaboration with the participating governments with the intention to help the governments and the international institutions to coordinate and accelerate their collaborative investment activities.

The Second EATL Ministerial Meeting (26 February 2013) endorsed the Phase II final report and supported to the next phase of the project in its Joint Declaration.

Main goals of the project

The Euro-Asian Transport Links project is aimed at three main interconnected goals, or three project domains:

1) Developing the Euro-Asian transit. This aspect of work is focused on providing conditions for increasing volumes of Euro-Asian trade via overland routes, primarily railway. The basic idea is to benefit from potentially shorter travel time - in comparison with the maritime routes - that would attract the time-sensitive segment of Euro-Asian trade. Since this idea was formulated during the St. Petersburg International Euro-Asian Conference on Transport in 1998, much had changed in Eurasian trade and transport. The trade volumes had significantly increased as well as the capacity of container ships operating on Eurasian routes. That, in turn, led to lower freight rates and the prospects of overland delivery seemed to be very bad. At the same time, the idea of intercontinental container trains that once looked as a very distant prospect had become the everyday reality for many shippers who now see these services as an attractive alternative to sea transport. The reasons for that are not only the growth of high-value commodities share and the “slow steaming” concept adopted by shipping lines. It should be stated that the efforts of the EATL countries - and other states interested in Eurasian links development - had really improved the conditions for overland trade.

Experts agree that the potential of Eurasian transit is not fully utilized and that the work on its development should be continued.

2) Addressing the challenge of the landlockness. Thirteen of the EATL area states - Afghanistan, Armenia, Azerbaijan, Belarus, Kazakhstan, Kyrgyzstan, The former Yugoslav Republic of Macedonia, Moldova, Mongolia, Serbia, Tajikistan, Turkmenistan and Uzbekistan – belong to the “family” of the landlocked countries that face special challenges associated with lack of direct territorial access to the sea, remoteness and isolation from world markets. For these countries, fragmentation of the supply chain in a poorly regulated transit process can add up to 50 per cent to transport costs between a landlocked country and a nearest foreign port. According to the World Bank, landlocked countries’ trade and incomes lag far behind those of transit countries and the global average.

The international community constantly pays special attention to needs of landlocked countries. The Almaty Programme of Action: Addressing the Special Needs of Landlocked Developing Countries within a New Global Framework for Transit Transport Cooperation for Landlocked and Transit Developing Countries, adopted in 2003, reflected the strong commitment of all actors to address the special development needs and challenges faced by landlocked developing countries and to promote their effective integration into the global economy through the

implementation, inter alia, of specific actions in the areas of fundamental transit policy issues, infrastructure development and maintenance, trade facilitation.

Currently the Vienna Programme of Action for Landlocked Developing Countries for the Decade 2014-2024 is under implementation. This innovative, holistic and results-oriented 10-year programme is based on renewed and strengthened partnerships to accompany landlocked developing countries. This Programme envisages individual and concerted efforts by the organizations and bodies of the United Nation system, relevant international organizations, etc., who are invited to give priority to requests for technical assistance and capacity-building support from landlocked developing countries in a well-coordinated and coherent manner, within their respective mandates.

Some of the specific goals and objectives of the Vienna Programme, such as promotion of efficient and cost-effective access to and from the sea by all means of transport, reducing trade transaction costs and transport costs and improvement international trade services, development of adequate transit transport infrastructure networks and complete missing links connecting landlocked developing countries, etc. – are fully consistent with the EATL project priorities.

3) Improving the environment for regional trade between the EATL countries, primarily – in the Central Asian area. The region had recovered from the transitional recession in the late 1990s, and during the 2000s emerged as one of the most dynamic economic regions in the world. Kyrgyz Republic, Tajikistan and Kazakhstan became WTO members in 1998, 2013 and 2015 respectively.

The region started the previous decade with strong links with Europe and important ties with the CIS. During the last decade, China has emerged as an important trading partner for Central Asia, particularly in natural resources while ties with Turkey have also intensified.

However, trade in the region is still below potential, with limitations in connectivity, market access, limited bilateral engagement and difficult trade and transport facilitation. Further development is limited by transport-geographical factors as well as by the institutional issues. Despite a long history as a center of global trade, the economic structure of Central Asia is currently characterized by low economic density and long distances.

It should be noted that the average level of economic development of the Central Asian countries makes the large-scale infrastructure investments very burdensome for their national budgets. In the context of the current economic situation, this fact becomes even more important.

At the same time, trade policy regimes throughout Central Asia are very uneven and often far from best international practice. They “...vary from liberal in the Kyrgyz Republic, to fairly liberal in Kazakhstan and Tajikistan and to quite restrictive in Uzbekistan. While tariffs are not particularly restrictive by global standards, tariff structures are complex and changes are not transparent or predictable and non-tariff measures are extensive and pervasive [18].

That is why adjusted “point-focused” investment projects undertaken together with institutional improvements seems to be the principal vector of connectivity development in the region.

Scope of work

This report presents the results of Phase III of the EATL project coordinated by the UNECE. The principle aim of Phase III is to identify the measures that will make the EATL overland links operational.

The Report focuses on the following issues:

- “snapshot” overview and the analysis of the current situation in transport and trade along EATL routes;
- review of current studies, programmes and initiatives on development Euro-Asian transport links recently undertaken at both national and international levels;
- identifying the main transport, trade, border-crossing, customs and transit obstacles hampering transportation and trade along EATL routes;
- developing the recommendations to overcome the identified barriers and further develop the trade across the EATL area.

The results of Phase III of the EATL project should create a platform for policymakers and operators to improve the situation and enhance opportunities for the overland transport in the future. The goal is to analyze the situation, identify obstacles and opportunities, propose solutions and encourage stakeholders to harmonize actions and act jointly along the EATL routes. It is also expected to boost political support for often painful reforms in the transport sector, border crossing facilitation, as well as in the management of large-scale transport investment programs.

Draft for information only

EXECUTIVE SUMMARY

General description of the project

The Euro-Asian Transport Links (EATL) project is a part of long-term collaborative work carried out during recent decades by international institutions and particular countries of the Eurasia to improve the conditions for trade and socio-economic development on the continent. The EATL initiative is aimed at three main interconnected goals, or three project domains:

- developing the Euro-Asian transit
- addressing the challenge of the landlockness
- improving the environment for regional trade between the EATL countries.

The project was undertaken in three phases.

Phase I (2002-07) had selected and prioritized the main Euro-Asian road, rail and inland water transport routes, transshipment points and ports. The first analysis of physical and non-physical obstacles hampering the trade via the surface Euro-Asian routes was undertaken.

Phase II (2008 to 2013) identified nine rail and nine road corridors (EATL corridors) which should be considered as principle transport links between Europe and Asia. Main projects linked with the EATL corridors were proposed by the participating countries.

The principle aim of Phase III is to identify the measures that will make the EATL overland links operational. The report contains:

- the overview of the current situation along EATL routes,
- the analysis of the main transport, trade, border-crossing, customs and transit obstacles hampering transportation and trade along EATL routes;
- the recommendations to overcome the identified barriers and further develop the trade across the EATL area.

General economic and trade situation

The current financial crisis is influencing the global economy and trade sharply and probably will for a long time stay as the dominating external factor. Because of that expected growth of international trade can't be considered as the main driver for Euro-Asian transport flows and transport links.

As regards the continental Euro-Asian links, the crisis situation has its negative impact in several aspects:

- a) the general slow-down of transport demand
- b) decreasing of the "critical mass" of traffic in landbridge corridors to keep the transport services across them sustainable
- c) limitations of the investment potential for infrastructure projects implementation

- d) growing gap between the shipping rates and the railway rates (which is one of the main disadvantages of the Euro-Asian landbridge).

At the same time, the current situation has some potential opportunities for the EATL transport routes development. A portion of time-sensitive transit can be redirected through inland EATL routes due to “slow steaming” introduction on the maritime routes. Besides that, such events as the start of “One Belt – One Road” Initiative, Creation of the Customs Union between the Russian Federation, Belarus and Kazakhstan, accession of the Russian Federation, Tajikistan and Kazakhstan to WTO improve the general political-economic climate across the EATL area.

Continental Eurasian links competitiveness conditions

Maritime transport is the dominating mode in the Euro-Asian trade. There are certain factors that make its market position stronger: slow steaming introduction, shipping alliances development and flexible tariff policy.

For objective reasons the Euro-Asian land bridge likely will never compete in volume with maritime routes. But it may well establish itself as a complement to shipping services increasing the reliability of high-value and time-sensitive supply chains.

The continental Euro-Asian transport network transport system is mainly already formed. The main routes are demonstrating the practical capability of expensive and time-sensitive cargoes delivery serving as a complement to maritime routes.

EATL transport routes combine the functions and features of different types of transport corridors: transport and trade transit corridors, access corridors and developing corridors. This gives wide development opportunities to EATL routes as the instrument of regional trade and development.

Competition of transport corridors on the Euro-Asian continent is not about the simple choice between transport routes and/or transport modes. It is the competition of logistic decisions based on intermodal services and value-added services and focused at the needs of particular supply chains. Main supply chains requirements are regular services, high punctuality, flexible costs, value added services availability, delivery speed appropriate for certain types of cargo. These requirements do not apply to particular sections of Euro-Asian routes, but to entire transport-logistic chains.

Decision making in supply chains, in particular – choosing the routes and modes - is made usually not by shippers themselves but by logistic operators: freight forwarders, 3 PL – providers, etc., who combine the understanding of the needs of particular supply chain with deep knowledge of transportation market and ability to put together the interests of numerous market players: carriers, terminal operators, infrastructure owners, etc.

Considering that, any transport route within the Eurasian continent will attract traffic and trade only being evaluated in the context of supply chains competition. No political decisions or investment projects developed beyond this context will be successful in this sense. For the same reasons the attempts to bind the freight flows within the corridors to particular fixed routes, points or to selected transport modes seem counterproductive.

Of course, there is no need to mention that further development of EATL continental links needs upgrading the infrastructure and elimination the non-physical barriers influencing the trade and transport flows.

Comparison of maritime and overland transit routes

Comparative analysis of maritime and overland routes connecting Europe and Asia is undertaken constantly in numerous studies in order to:

- demonstrate the principle advantages of particular overland transit corridors;
- choose the most competitive overland route among several options;
- evaluate the volumes of cargo that can be attracted to the overland routes, and so on.

Within the report several examples of the sea and overland routes comparative analysis are given, in particular:

- the upgraded fragment of the analysis undertaken during Phase II of the EATL research;
- the study undertaken by the Russian Centre for Economic and Financial Research at the New Economic School (CEFIR);
- the research provided by PLASKE – freight forwarding company involved into the Euro-Asian intermodal container transportation;
- the Eurasian Development Bank study.

The analysis shows that there are segments of undisputed “maritime domination”, but under certain conditions regular railway overland transit can be attractive to shippers. In the current situation competitive railway services in EATL transit corridors can develop under the following conditions:

- a) location of Asian terminal points in North-Western China
- b) location of European terminal points in Eastern Europe and
- c) existence of guaranteed flow of high-value and time-sensitive cargo (automotive parts, electronics, etc.) from one shipper or a limited group of “anchor” shippers as a basis for sustainable regular service. Besides, the service should be better operated not by pure railway carrier but by market-oriented logistic operator experienced in design of transport-logistic chains.

Railway transport.

Railway transport should play the leading role within the EATL transport links, primarily, in the sector of intermodal services. To achieve that, the railways should:

- widely cooperate with freight forwarders, terminal operators, trucking companies, logistic providers;

- offer cost-based competitive tariffs and have the opportunity to change them according to the market situation;
- be flexible in routes and schedules choice;
- cooperate internationally to provide long-haul services.

All this needs a liberalized market-oriented environment across the entire international railway routes. Such an environment can be created in the course of the railway structural reforms.

The EATL area is the sphere of the railway reforms that seem necessary to make overland routes effective and competitive. In different groups of EATL countries the reforms are developing according to different models and have different pace.

The first group of countries - Belgium, Bulgaria, Croatia, Finland, France, Germany, Greece, Italy, Latvia, Lithuania, Luxembourg, Poland, Portugal, Romania, and Spain - is formed by the EU member states which follow the EC railway reform directives also known as EC railway packages.

The second group is formed by the EATL countries that have expressed their intention to join the EU: Bosnia and Herzegovina, the Former Yugoslav Republic of Macedonia, Montenegro, Serbia, and Turkey. Being within the Stabilization and Association Process which precedes the country's accession to the European Union they are also developing their railway structural policy according to the principles of the EC railway packages.

The third group of countries contains the former republics of the USSR: Armenia, Azerbaijan, Belorussia, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, and Uzbekistan. They, in turn, can be separated according to the achieved reforms progress:

- countries that have made certain progress in reforms developing the "Russian" reform model that is not alike neither "European" nor "American" one: Russian Federation and Kazakhstan;
- countries, where reforms are widely discussed and some legal acts are adopted, although practical steps seem to be moderate: Ukraine and Uzbekistan;
- countries, where reforms had not been even seriously planned: Armenia, Azerbaijan, Belarus, Kyrgyzstan, Moldova, Tajikistan, Georgia, Turkmenistan.

Group four includes Asian countries that do not belong to neither of the previous three groups. They are characterized by completely different situation in the railway industry and railway reforms: Afghanistan, China, Iran, Mongolia, and Pakistan.

Whatever model is chosen, the market transformations of the railway industry should be among the main priorities for EATL countries.

Road transport

It can be assumed that the role of road transport will grow in the most of the EATL countries following the demand for high quality and flexible logistic services.

The road transport within the EATL corridors should be harmonized with railway services and complete them rather than directly compete with rail. In particular, the following main spheres look reasonable:

- short-run cross border trade;
- long haul transportation on the lanes where railway links do not exist or can't provide effective services for certain commodities (perishable, expensive, etc.);
- "road section" of intermodal rail-road transport service. This section connecting the consignor (consignee) and intermodal terminal or logistic center can be hundreds or even thousands kilometers long.

The last option is the most important one from the point of view of logistic supply chains transport provision and improving the competitiveness of EATL links.

For effective long-haul trucking it is important to provide the even weight/length limitations for road transport along the main EATL routes. Besides that, the option of the long/heavy road vehicles was analyzed. It seems useful to use the experience of numerous countries of opening certain routes with low traffic density and appropriate profile for road trains which could substantially increase the efficiency of road transportation in the EATL region.

Sea ports

According to the contemporary logistic approach, sea ports should not be analyzed or developed as isolated units. Development plans should consider also the port hinterland connections and the infrastructural objects located in the hinterland and directly linked to sea ports (logistic centers, dry ports, inland intermodal terminals). Such an approach should be used while developing national transport policies and infrastructure development plans, as well as in the regional documents adopted by EATL countries.

The analysis showed that the most important sea ports from the point of view of the EATL system development are ****

These ports have a relatively high throughput, demonstrate good progress in throughput during 5 recent years and/or provide direct ocean access on the foreland side.

Logistic centers and dry ports

Logistic centers are considered to be the mandatory components of logistic infrastructure carrying on numerous functions in the supply chains.

Logistic centers developed within the EATL network should become the modern market-oriented nodes of supply chains improving the competitiveness of the entire EATL system carrying on the following functions:

- acting as the points of local integration/distribution of goods in particular areas;
- serve as effective warehousing zones directly connected to transport services;

- being points of smooth transshipment between rail and road (as well as between different railway links) within intermodal transport services;
- act as platforms for industrial zones linked transport-logistic network;
- provide the possibility for value-added services execution within the supply chains;
- being located nearby the borders – provide infrastructure for effective border check procedures;
- being located on the connection points of different rail gauges – give opportunity to combine boogies exchange or freight transshipment with intermediate warehousing and/or value-added services.

Main obstacles hampering the Euro-Asian transport linkages development

The existence of high-level transport infrastructure – railways, roads, inland waterways - is a necessary, but not a sufficient condition for efficient and competitive transport routes serving the trade lanes. Numerous obstacles and bottlenecks along transport routes occur disrupting the traffic and goods flows. These obstacles can be divided into physical and non-physical barriers.

Non-physical barriers seem to be the main problem for Eurasian linkages especially in the region of the Central Asia. Unlike Europe, this region is characterized by a “spaghetti bowl” of international organizations, initiatives, programs and projects. Obligatory border procedures at numerous national borders do not make the situation easier. This leads to very high level of legal and administrative fragmentation characteristic of transport routes and trade lanes in the region.

The obstacles hampering the Eurasian trade and transport manifest themselves primarily at the border crossing points. The main non-physical barriers concern border crossing technologies and procedures (inadequate infrastructure, process inefficiencies), transported goods (Customs procedures, Export and import documents) and specific transport modes. “Political” issues caused by international or domestic political conflicts and related to unclear or inconsistent transport and trade policy are also among the barriers across the Eurasian trade.

Main recommendations

The SWOT-analysis of the EATL transport communications was developed which, in turn, gave the opportunity to create the “EATL Roadmap to 2030”. The roadmap is designed in the form of “Challenges – Opportunities – Solutions” matrix.

The principle solutions indicated in the matrix are put down in the form of the recommendations in the following spheres:

- policies;
- facilitation, procedures, and institutions;
- infrastructure development.

EATL seems to be the most comprehensive of all initiatives aimed at facilitation of trade and transportation across the Eurasian region. Thus it seems reasonable to continue the activities under the EATL “umbrella” in the format that will be found appropriate by the EATL countries.

The main recommendations in the policy sphere are formulated as follows:

- Continue the activities within the EATL project in co-ordination with other similarly focused initiatives
- Analyzing and dissemination of best decisions and models in the sphere of international trade and transport
- Improve the monitoring and high-level coordination of regional initiatives, programs and projects
- Develop co-operation at the business level together with intergovernmental cooperation
- Encouraging development of the freight-forwarding and high level logistic providers segment
- Put railway reforms among highest policy priorities

During the crisis times high-scale infrastructure investments seem to be a serious burden for many EATL countries. That is why institutional reforms and trade facilitation should be the leading priority in comparison with infrastructure projects

The main recommendations in the sphere of facilitation, procedures and institutions are formulated as follows:

- Movement towards the universal legal regimes and administrative procedures across the Eurasian area based on best international practices
- Introduction of best international practices in new-adopted trade and transport legislation
- Inter-harmonizing provisions of regional and bilateral agreements
- Developing institutions and procedures facilitating the long-haul container trains operation and related activities
- Paying special attention to procedures accelerating trade and transport operations
- Introduction of best international experience in newly adopted railway legislation

To date, the EATL transport network has been very nearly formed and proved its efficiency for certain trade lanes and commodities. Numerous initiatives, programmes and projects are undertaken to improve the infrastructure in the EATL region. It seems reasonable to focus the efforts on coordination, standardizing of infrastructure parameters and implementing the most effective “point-focused” projects.

The main recommendations in the sphere of infrastructure development are formulated as follows:

- Eliminating bottlenecks and missing links on the potentially most effective overland transit routes and trade routes in the EATL area
- Encouraging introduction of public-private –cooperation and other market-oriented forms of infrastructure projects financing
- Coordinating of infrastructure programs and projects. Developing the “system approach” to infrastructure programs developing the transport and logistic infrastructure in the interests of the entire economy
- Advanced development of railway and logistic infrastructure providing effective container transportation
- Paying special attention to infrastructure projects providing time-effective transportation
- Introduction of effective mechanisms of railway infrastructure development in reform programs

I. EURO-ASIAN TRADE ROUTES AND FREIGHT FLOWS

I.1 Economics and trade current situation in EATL Region

I.1.1. General overview: world trade and economics

The 2008–2009 financial crisis had significantly influenced the global economy and trade. According to the WTO, the crisis brought about a 12 per cent drop in the volume of world trade in 2009, which was the sharpest decline recorded in more than 70 years.

Like global economic activity, international trade remains subdued. Between 2012 and 2014, the rate of growth of world merchandise trade (by volume) oscillated between 2 and 2.6 per cent (figure 1.2). These growth rates are significantly below the average annual rate of 7.2 per cent recorded during the 2003–2007 pre-crisis period.

World trade growth remained modest in 2015 following three years of weak expansion. Annual increases in merchandise trade in volume terms were very small in that period, measuring just 2.5 per cent in 2014, 2.5 per cent in 2013, and 2.2 per cent in 2012. The exports of developing and emerging economies grew faster than those of developed countries in 2014, 3.1 per cent in the former and 2.0 per cent per cent in the latter. Meanwhile, imports of developing countries grew more slowly than those of developed economies, 1.8 per cent compared to 2.9 per cent.

According to UNCTAD, in 2015-2016 merchandise trade remains largely insufficient to provide, by itself, a significant stimulus to economic growth.

To be completed

Table 1.1. Export and import volumes of goods, selected regions and countries, 2011-2014 (annual percentage change)

Region/country	Volume of exports				Volume of imports

The analysis shows that current financial crisis is influencing the global economy and trade sharply and probably will for a long enough period stay as the dominating external factor. Because of that expected growth of international trade can't be considered as the main driver for Euro-Asian transport flows and transport links, as it was during Phase I and Phase II of the EATL Project.

EATL countries general overview

The geographical space covered by the EATL routes stretches from the North and Baltic Sea in the North to the Mediterranean and the Indian Ocean in the South, Western Europe in the west and the coast of the Pacific Ocean in the east. Of the countries that currently participate in the EATL project, 11 belong to Commonwealth of Independent States (CIS). These countries are the three Eastern European states - Belarus, Moldova, and Ukraine, the five Central Asian states - Uzbekistan, Turkmenistan, Kyrgyzstan, Tajikistan and Kazakhstan, two Caucasus republics - Armenia and Azerbaijan, and Russia. The EATL routes also cross four countries that do not belong to the CIS, China, Georgia, Iran, and Turkey, and connect those CIS and non-CIS countries to EU-28 countries, Afghanistan, Pakistan and Mongolia.

This section does not cover all EATL project member countries. Only those countries, which an EATL route crosses, have been described including all CIS countries, China, Georgia, Iran and Turkey.

The economies of these 15 countries differ in size and industry composition. Most of the CIS countries have gone through transition from centrally planned to market economies, but the transformation processes are uneven, and Turkmenistan and Uzbekistan are only slowly opening up their markets.

With Tajikistan's accession to the WTO in March 2013 eight CIS countries are now WTO members and five are observer members (see table *). Belarus, Kazakhstan and Russia form a Customs Union that is the central pillar of the single economic space of the Eurasian Economic Union (EEU or EAEU), and Kyrgyzstan and Armenia have signed accession agreements to this Customs Union. CIS countries have also signed multiple bilateral and multilateral trade agreements, such as the CIS Free Trade Agreement (CISFTA), with each other granting preferential treatment to their goods (see table 1.2).

Several of the 12 EATL CIS countries are "oil exporters", meaning that energy commodities, such as oil or natural gas, account for a large share of their total exports. China, Russia and

Turkey are the biggest economies in the EATL network. In 2013, their combined GDP of 12'157'254 million US\$ represents 92% of the total economic activity of EATL countries.

CIS countries have seen a continued growth of their economic output in the past years. The Kyrgyz economy has grown by 10.5 per cent from 2010 to 2014, Turkmenistan by 10.2 percent and Uzbekistan by 8 per cent during the same period. The Caucasus and Central Asian (CCA) countries that are not "oil-exporters" are expected to have the strongest growth.

As can be seen from table 1.1, Russia is not only the biggest economy of the CIS in terms of GDP but also in terms of merchandise trade. Russia's exports accounted for 523'294 million US\$ in 2013, while Tajikistan only exported goods with a value of 1,163 million US\$. Armenia and Tajikistan have the lowest export and import volume, and are at the bottom of the export (117 and 123 rank respectively) and import ranking (106 and 108 rank respectively) established by the WTO.

Draft for information

I.2. Euro-Asian trade routes

Sources: UN Comtrade, UNCTAD, WTO, National statistical agencies, etc.

Scope of the analysis: Volume and structure of international trade between Europe and Asia. Trends and prospects. (region-to-region, country-to-region, country-to-country matrix on export and import of goods. Identification of main trade partners, commodity groups, containerized cargoes).

Timeframe: 2010-2014/2015, 2015/2016 estimations

Methodology: statistical patterns and trends, comparison analysis, structural analysis

Data To be inserted

I.2.1. Trade routes general development

Modern supply chains and transport corridors

Modern supply chains characteristics

“Supply chains compete, not companies” - this principle developed by Martin Christopher, one of the classics of logistics and supply chain management, is the key to understanding the current situation and the prospects of global trade lanes, in particular – the Euro-Asian.

In the course of supply chains competition requirements to transport corridors and transport operators are established. Supply chain managing entities choose the trade routes and service providers.

Globalization together with introduction of logistics principles into production, trade and distribution had dramatically changed the nature of supply chains during the recent decades. To be adequate to their desirable role, EATL corridors should meet the requirements of modern supply chains for which the corridors provide proper connectivity, capacity and economic efficiency.

The following principal features of modern supply chains should be mentioned in this context.

1) Integrated management. The first principle feature of modern supply chains that, in many ways, predetermines the rest is the presence of the integrated management.

Traditional supply chains (the “old” Silk Way is probably the best historic example) had represented the long enough series of sales in the trading cities along the route connected by trade caravans on land or by commercial shipping. Fragmentation was the key characteristics of the players’ relationship. Each of them was interested and responsible only for one particular chain link.

Modern supply chains are under the constant control which is usually carried out by high level logistic providers acting on behalf of the focus companies of the supply chains. The entire logistic network within the supply chain is constantly customized according to the market situation.

Functions, costs, responsibilities and risks are distributed among the players and planning is done across the supply chain according to the strategic interests of the whole system.

The management criteria within the supply chain are way more complicated than just “time and costs”. The economic idea of supply chain management is sometimes expressed as “to reduce the total cost of owning materials and services across the entire chain”, which leads to integrated control of stock – either moving or at rest - as well as of all kinds of services, costs, risks, etc.

Accordingly, modern supply chains managers are not using just one particular “best” route or mode of transportation or transport operator while making transport decisions. They need to have several options to combine them within the currently optimal decision. Their choice is not only the transport route itself, however “short” or “fast” or “cheap” it can be. The logistics business environment along the trade lane, availability of logistic services, friendly and predictable administrative procedures, ability to flexibly switch the flow between different intermediate points – all this is important in decision making as well as political stability along the entire trade lane and safety and security factors.

2) Flexible routing. While the traditional supply chain is something like the fixed sequence of nodes and links between the origin and destination points, the modern supply chain looks more than a network connecting the regions where commodity flows are nucleated and absorbed. The actual routes can vary within this network depending on the changing situation on the commodity markets served by the supply chain and on the transport services market.

In many cases the actual route is not the shortest one, even for one particular mode, because of the hub&spoke technologies often used by long-haul transport operators (for the sake of transport flows efficiency) and logistic providers (for the sake of commodity flows efficiency).

3) Special role of nodes. Nodes of traditional supply chains – sea and inland waterway ports, railway stations, etc., had always performed the obviously necessary connecting and transshipment functions within the supply chains. At the same time traditionally they also created inevitable obstacles for traffic and cargo flows, sometimes being the bottlenecks within the supply chains.

“Traditional” node is the spot where the flow of vehicles and commodities is interrupted and players that have to co-operate in resumption of this flow often have contradictory interests. Some local players – both state agencies and commercial intermediaries - pursue pure revenue goals. The procedures are often aimed not at speeding the process but at collecting more fees (formal and sometimes informal). Scarcity of resources is a typical system problem and long enough waiting time for cargo - either onboard the vehicles or in the warehouses - is a rule. Different types of cargo are handled which aggravates the problems. Additional services adding to the total value of goods are rare. The market position of the “traditional” node is often a monopoly since it gains an advantage, primarily, due to its geographical position.

Nodes of modern supply chains are quite different. Supply chain connectivity and fastening of flows is the main goal for the players in charge, including the governmental agencies. Fast and cheap transshipment is the main efficiency factor. The technologies used are focused on intermodal units, primarily – containers. Handling operations are complemented by value added logistic services. Nodes compete with each other because their main advantages – services quality and price as well as the set of transport services catering for particular node – do not so much depend on the location factors.

4) Intermodality. Modern intercontinental supply chains are intermodal by their nature. Most of origins and destinations in the Euro-Asian trade in principle can not be connected by services of

one single transport mode. It means that in spite of intermodal competition (which is one of the drivers of transport system efficiency) different modes are compelled to co-operate within the transportation process. If the transport operator is in the position to succeed in the supply chain it must either be capable to design intermodal transport product engaging other modes' operators on attractive terms (as many shipping companies do) or it should be ready to be engaged to participate in such a product designed by someone else. The latter means offering reliable transport service with guaranteed parameters as well as meeting the technological standards for intermodal transportation.

5) Regular transport services. One of the most important qualities highly valued in modern supply chains is the availability of regular transport services. Regular service with pre-announced call points, schedules and tariffs is ideal from the point of view of supply chain design and planning and it can be utilized on the "plug and play" basis without additional trimming. It is commonly accepted that the minimum frequency of the regular long-haul transport service suitable for most international supply chains is a weekly service although the well-developed trade lanes show the example of several serviced a day offered by a number of competing transport operators. Combining the regular services of different modes (e.g., ship and rail) allows creating efficient intermodal transport services within the supply chains.

Types of corridors

Summarizing the classifications proposed by numerous researchers (Arnold (2005), Kunaka&Carruters (2014), Rastogi and Arvis (2014) and others), the following types of transport corridors can be specified:

- *transport transit corridor* that provides smooth, fast and cheap movement of vehicles along the specified route. The main performance indicators for transport transit corridor are the speed, cost and safety of transportation. Corridors of this type are often created at the national level or they pass through the group of countries within a free trade zone. Accordingly, the efforts while creating the transit corridor are focused on infrastructure and transportation technologies. The main beneficiaries of this type of corridors are transport operators who achieve the decrease of operational costs and vehicle turnover time and can share these positive results with their customers. Transport transit corridors can also generate environmental benefits;

- *trade transit corridor* that provides smooth, fast and cheap movement of goods along the logistic supply chains. Trade transit corridors usually cross at least one frontier where the trade flow is interrupted by a set of customs, sanitary and other border procedures. The main performance indicators for transit corridor are the speed, cost and safety of merchandise movement and distribution. Besides that, the spectrum and quality of value added logistic services is important. In addition to the mentioned above transport component creating the effective trade transit corridor envisages also the improvement of the administrative procedures along the corridor.

The main beneficiaries of this type of corridor are located in the origin and destination regions which can lead to a "transit country paradox" - the cheaper and faster is the trade lane within the corridor the less is the revenue of the transit countries. More, substantial traffic on transit routes can lead to limitations of their national transport system capacity;

- *access corridor* which is created to approach some point or region. Typical access corridors give the landlocked countries the opportunity to trade via foreign seaports. The performance of this type of corridor can be measured by the trade-related costs level "with and without the project". National economies of the countries originally isolated from the destination point benefit from the access corridor. To be effective, it needs not only the well developed transport

infrastructure but also a logistics “interface” represented by terminals and distribution centers. A market segment of transport operators, freight forwarders and high level logistic providers is also necessary to help the national business to benefit from the access corridor;

- *developing corridor* provides the conditions for socio-economic development of particular economic region. Developing corridor project is usually interconnected with numerous regional projects of mining, town-planning, plant construction and so on. The corridor plays the role of backbone of the regional development serving the needs of the growing industry, social sphere, creating jobs, increasing the territory value. The list of beneficiaries can be long enough including regional and national authorities, site-developers, local population, etc.

Cooperation

EATL corridors, to a great extent, combine the features of all the types of corridors mentioned above.

This, on one hand, makes the list of possible benefits impressive enough. On another hand, the countries participating in the EATL should have a clear understanding of possibilities, costs, benefits and risks that particular projects mean to them and their partners.

EATL corridors successful development does not mean just improving the quality of the infrastructure on specific routes. Equally important are institutional factors such as general business environment level, quality and scope of services available, customs and border control procedures, and all the related trade or transportation policies that affect logistics performance.

Cross-border cooperation is critically essential either because the supply chains are only as strong as their weakest link is. Balanced and coordinated logistics strategy is the keystone for EATL countries, especially Central Asian, since they depend on each other in attracting transit flows and in development of their own global trade links.

Thereby, a corridor is not just an infrastructural concept. Strategically, the corridor idea is about organizing the economic activities on particular territories. Different transport modes are used just to effectively link these activities together. The success of a corridor is thus in part a function of the coalitions that parties are able to form to attract investments and improve performance. How the parties collaborate to manage a corridor is a key dimension of the definition of a corridor. Institutional and economic relationships are part and parcel of a corridor, especially in the presence of competing trade routes [Kunaka, Karruters].

Unfortunately, at the moment cooperation is not among the strong features of the EATL routes network. “The paradox of the modern Silk Route is that despite changes in transport technology its governance and organization are reminiscent of the old Silk Road. The latter depended on fragmented caravan trade. No direct business connection was in place between buyers and sellers, and trade happened through along and costly series of sales in the famous trading cities along the route” [Rastogi, Cardoula].

Supply chain fragmentation is the principle problem of the EATL routes to be tackled strategically. The situation is exacerbated by a lack of skills and a limited culture of market-focused supply-chain management among both private and public sector. The private sector that has a key role in provision of modern supply chains connectivity is not enough developed in certain EATL countries, particularly in Central Asia. A limited presence of international logistics brands leads to a limited exposure to international best practices of supply-chain management.

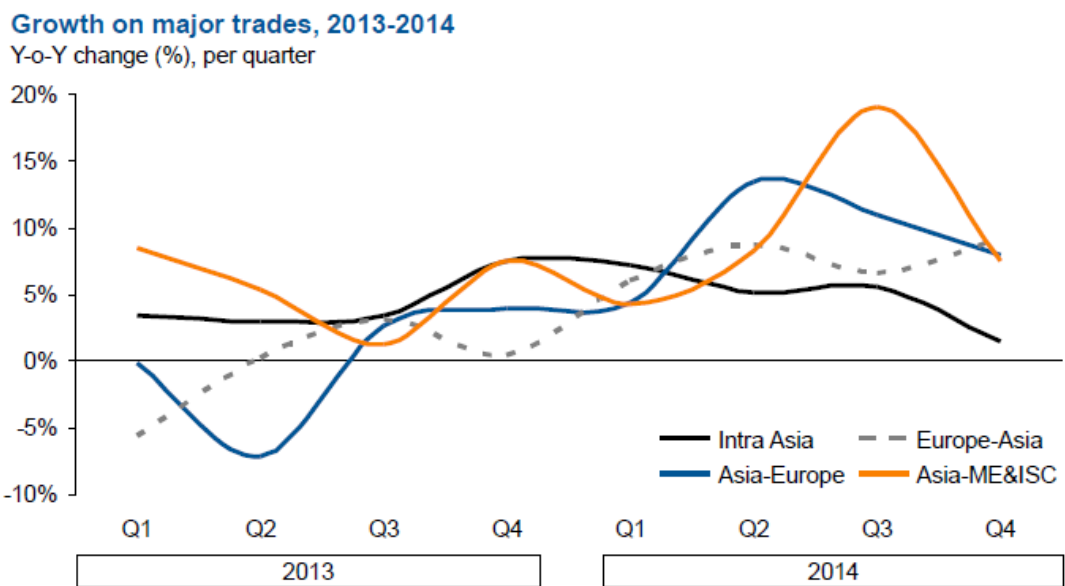

Trade lanes general development

Despite of the general economic situation, the Euro-Asian trade is the main generator of the global trade. World export growth is mainly driven by Asia and Europe.

According to Seabury Cargo Advisory, Chinese export growth alone is responsible for almost 50% of all TEU growth in 2014, followed at a distance by growth from South East Asia and Europe. Export growth in North East Asia is negative if China is excluded.

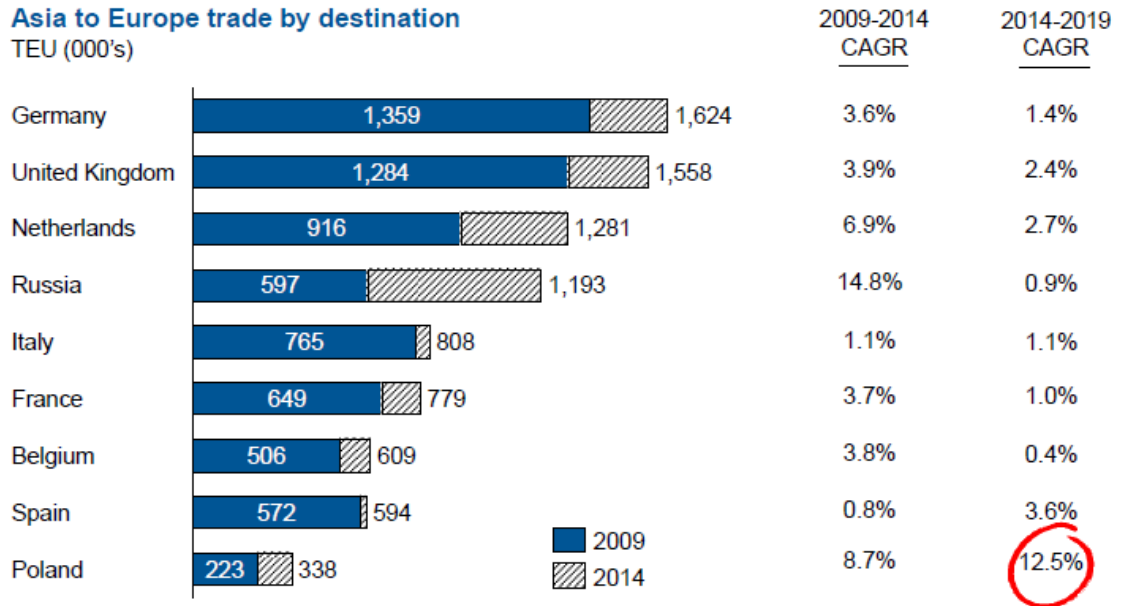

Asia to Middle East and Indian Subcontinent trade is growing faster than Asia-Europe. This trade lane is also dominated by China. At the same time, Asia to Europe trade is slowing down. With the exception of Spain and Poland, all major destinations on the Asia-Europe trade are expected to see a slowing of growth the coming 5 years.

Although the Asia/Europe trade is expected to slow down, some commodities will still show increasing growth rates

1.2.3. Main commodity groups

The Group of Experts on Euro-Asian Transport Links (EATL) at its eleventh session (ECE/TRANS/WP.5/GE.2/2 (Paragraph 14)) requested the secretariat to send out a questionnaire to selected ports and ask for information about the type of cargo and transport passing through ports relevant to the EATL project.

The information received from ports includes three parts of cargoes:

1. Cargoes identified as suitable for overland transport between Europe and Asia.
2. Synergies between overland and maritime transport types of cargoes.
3. Cargoes most relevant for the Euro-Asian maritime transport.

Cargo that can be transported by rail or road from Europe to Asia and vice versa covers a rather limited niche market which includes high value and small volume goods, especially the ones that may be containerised. Those are goods for which air transport is too expensive, while maritime transport is too slow. These cargoes includes the following Standard International Trade Classification (SITC) positions (Table **):

Table ** Cargoes identified as suitable for overland transport between Europe and Asia or shiftable from maritime to overland transport

Commodity Group	Description
SITC 08	Edible fruit, nuts, peel of citrus fruit, melons
SITC 09	Coffee, tea, mate and spices
SITC 11	Milling products, malt, starches, inulin, wheat gluten
SITC 12	Oil seed, oleagic fruits, grain, seed, fruit, etc, nes
SITC 13	Lac, gums, resins, vegetable saps and extracts nes
SITC 14	Vegetable plaiting materials, vegetable products nes
SITC 15	Animal,vegetable fats and oils, cleavage products, etc
SITC 16	Meat, fish and seafood food preparations nes
SITC 17	Sugars and sugar confectionery
SITC 18	Cocoa and cocoa preparations
SITC 19	Cereal, flour, starch, milk preparations and products
SITC 20	Vegetable, fruit, nut, etc food preparations
SITC 21	Miscellaneous edible preparations
SITC 22	Beverages, spirits and vinegar
SITC 23	Residues, wastes of food industry, animal fodder
SITC 24	Tobacco and manufactured tobacco substitutes
SITC 25	Salt, sulphur, earth, stone, plaster, lime and cement
SITC 29	Organic chemicals
SITC 30	Pharmaceutical products
SITC 31	Fertilizers
SITC 32	Tanning, dyeing extracts, tannins, derivs,pigments etc
SITC 33	Essential oils, perfumes, cosmetics, toileteries
SITC 34	Soaps, lubricants, waxes, candles, modelling pastes
SITC 35	Albuminoids, modified starches, glues, enzymes
SITC 36	Explosives, pyrotechnics, matches, pyrophorics, etc
SITC 37	Photographic or cinematographic goods
SITC 38	Miscellaneous chemical products
SITC 39	Plastics and articles thereof
SITC 40	Rubber and articles thereof

Commodity Group	Description
SITC 41	Raw hides and skins (other than furskins) and leather
SITC 42	Articles of leather, animal gut, harness, travel goods
SITC 43	Furskins and artificial fur, manufactures thereof
SITC 44	Wood and articles of wood, wood charcoal
SITC 45	Cork and articles of cork
SITC 46	Manufactures of plaiting material, basketwork, etc.
SITC 47	Pulp of wood, fibrous cellulosic material, waste etc
SITC 48	Paper & paperboard, articles of pulp, paper and board
SITC 49	Printed books, newspapers, pictures etc
SITC 50	Silk
SITC 51	Wool, animal hair, horsehair yarn and fabric thereof
SITC 52	Cotton
SITC 53	Vegetable textile fibres nes, paper yarn, woven fabric
SITC 54	Manmade filaments
SITC 55	Manmade staple fibres
SITC 56	Wadding, felt, nonwovens, yarns, twine, cordage, etc
SITC 57	Carpets and other textile floor coverings
SITC 58	Special woven or tufted fabric, lace, tapestry etc
SITC 59	Impregnated, coated or laminated textile fabric
SITC 60	Knitted or crocheted fabric
SITC 61	Articles of apparel, accessories, knit or crochet
SITC 62	Articles of apparel, accessories, not knit or crochet
SITC 63	Other made textile articles, sets, worn clothing etc
SITC 64	Footwear, gaiters and the like, parts thereof
SITC 65	Headgear and parts thereof
SITC 66	Umbrellas, walking-sticks, seat-sticks, whips, etc
SITC 67	Bird skin, feathers, artificial flowers, human hair
SITC 69	Ceramic products
SITC 70	Glass and glassware
SITC 72	Iron and steel
SITC 73	Articles of iron or steel
SITC 74	Copper and articles thereof
SITC 75	Nickel and articles thereof
SITC 76	Aluminium and articles thereof
SITC 78	Lead and articles thereof
SITC 79	Zinc and articles thereof
SITC 80	Tin and articles thereof
SITC 81	Other base metals, cermets, articles thereof
SITC 82	Tools, implements, cutlery, etc of base metal
SITC 83	Miscellaneous articles of base metal
SITC 85	Electrical, electronic equipment
SITC 86	Railway, tramway locomotives, rolling stock, equipment
SITC 87	Vehicles other than railway, tramway
SITC 90	Optical, photo, technical, medical, etc apparatus
SITC 91	Clocks and watches and parts thereof
SITC 92	Musical instruments, parts and accessories
SITC 93	Arms and ammunition, parts and accessories thereof
SITC 94	Furniture, lighting, signs, prefabricated buildings
SITC 95	Toys, games, sports requisites
SITC 96	Miscellaneous manufactured articles

Electronic products are mostly transported from China to Europe, whereas there is an increasing interest to move automotive components, finished products (cars), pharmaceuticals, chemicals and food (including frozen foods) from the EU to China.

Cases of specific services include the following ones:

- The Chongqing-Xinjiang-Europe train carries electronics, cars, and medical equipment;
- The international cargo train (Chang'an) from Xi'an to Rotterdam carries trucks, steel, aluminium, apple juice and electric power control units;
- The Zhengzhou-Xinjiang-Europe train carries electronic products, construction machinery, vehicles and parts, medical equipment and other high value products;
- The Suzhou-Manchuria-Europe train (through Siberia) carries liquid crystal monitors and laptops.

Regarding temperature sensitive products, DHL introduced in January 2014 the first temperature-controlled rail container service between China and Europe on a year-round basis.

Railways are good alternative to maritime transport in the case of high value and small volume goods. Therefore, in the case of products that need to be delivered rather fast and on time, railways offer a good option.

Other cargo not mentioned above, is not typically transported by rail and generally does not present good candidate for transport by rail (or road) from Europe to Asia or from Asia to Europe. In general, cheap and bulky products such as raw materials, petroleum products and liquefied gas are not transported overland between Europe and Asia.

Synergies between overland and maritime transport

Overland and maritime is a typical combination of transport modes between Europe and Asia transport and much attention is devoted to its development. The goal of such a synergy should be to achieve the most efficient combination of low cost transport (maritime transport) and low travel times (railways). An example that has gained much attention in recent years is the transport of goods by sea from China to the port of Piraeus (Greece) and by rail from Piraeus to major distribution centres in Central Europe. This type of transport may be enhanced by further improving the connection and reducing the handling time during the transfer process, between modes.

The strongest synergy between overland and maritime transport occurs in container transportation. In recent decades the containerisation of cargos is developing rapidly due to possibility for easy and fast change of transport modes. For example, the hinterland destinations for containers from the port of Riga (Latvia) are the Russian Federation, Ukraine, Belarus, Kazakhstan and Central Asian countries. To enhance synergy between overland and maritime transport, it is necessary to develop rail infrastructure to those destinations in Asia and to open new reliable and fast container train services with minimised border control, customs and other bureaucratic burdens.

The Port of Riga has a strong interoperability between maritime and overland transport for dry bulk cargo from the Russian Federation, Kazakhstan and Central Asian countries. To enhance this, it is necessary to improve the port infrastructure and access infrastructure from/to hinterland, to synchronize the port operations and to avoid bottlenecks in cargo handling. For example, at the Port of Riga the maritime infrastructure is fully developed to handle large *Panamax* type vessels, but the rail infrastructure at the port and access to rail infrastructure is not sufficient to receive large amount of dry bulk cargo at the short period of time to allow simultaneous rail-sea handling at the port.

When transporting export cargoes from Uzbekistan, synergy is observed in the transport between such goods as cotton and mineral fertilizers. The greatest effect of the synergy is observed in the reduction in the cost of transport of these types of goods to the nearest seaport.

The inter-modal change between maritime and railway transport can be developed by unifying the railway system that differs the CIS countries from other European countries. For instance, in Turkey a project was concluded in Samsun Port for a change of gauge of the wagons coming from the CIS countries to Turkey.

The types of cargo that might have strong synergies between overland and maritime transport include petroleum products, machinery and other manufacturing products, chemicals, building minerals, solid mineral fuels, foodstuffs, agricultural products, crude oil, metal waste and metal products, chemicals and fertilisers.

Challenges in Euro-Asian maritime transport

Maritime transport is without doubt the dominant transport mode between Asia and Europe, which until recently, exhibited an average growth rate of over 6% per year. This continuous and significant increase in maritime trade, along with other developments in the sector such as increased vessel size, however, has resulted in major congestion problems at several ports and other freight hubs, and has created serious environmental concerns. Traffic concentration problems, both at ports and hinterlands are particularly evident in China, where there are several constraints in access to the hinterland.

Slow steaming practices of the shipping lines aiming to reduce fuel cost and lengthy detours often taken to avoid extremely congested ports, have significantly increased trip durations. Congestion, along with the increase in labour costs, especially on the east coast of China, partly attributed to the workers getting organised in unions and fighting for higher wages, have resulted in several industries locating their manufacturing facilities in the western parts of China and using air transport for moving goods to Europe. As air transport becomes more expensive, rail may increase in relevance.

Another important problem in the maritime transport is the increasing number of piracy incidents. Safety of goods and crew is very important and for this reason companies often prefer to take longer routes instead of risking getting involved in a piracy event. This however does not come without a consequence, as it leads to higher costs and increase in the overall travel time. Cargo security, however, can also be an issue in overland transport between Europe and Asia.

Currently the competitiveness of rail transport from Asia to Europe is limited by undeveloped rail infrastructure in some parts of Asia. Other limiting factors are border crossing (customs and other complicated) bureaucratic procedures which increase the transportation time and costs. Due to those reasons, air transport is the most appealing for high value, small in size or perishable cargo.

Road transport is, for example, important for the Port of Riga. Of all containers coming by sea, 80 % are delivered to destinations in the hinterland (Baltic countries, Russian Federation, Kazakhstan, Central Asia and even Afghanistan) by trucks. Undeveloped rail network in those destinations makes road transport more competitive because of 'door to door' and 'just in time' deliveries.

An important problem for container cargo is a necessary repositioning of empty containers due to imbalance in containerised cargo flow in direction of Europe and Asia. For most of transport operators it is necessary to find ways how to increase containerised cargo flow in both directions, to avoid transportation of empty containers.

In order to enhance the synergy between the transport modes, facilitation of border crossings with simple border procedures are of utmost importance. Facilitation of the port procedures may have direct and substantial effect on expediting the operations at the container terminals because containerised cargoes require fast exchange of information.

The fact that there are two different transport legal regimes and documents as well as different track gauges in OSJD member countries and OTIF members leads to additional formalities and hence waste of time.

The biggest problem that exists in the Euro-Asian maritime transport refers to transport times which are extremely long. This problem could be overcome by the use of more efficient sea lines, combination with other modes of transport and improved time consuming procedures when the ships are arriving and departing from ports. Proposals are:

- To improve communication and to simplify the exchange of information between the different parts of the logistic chain.
- Customs have a key role in the facilitation and the boosting of trade. Customs rules and procedures should be efficiently implemented with a view to shortening the time thereby reducing the impact in terms of cost and time for business.
- A major challenge is to meet the environmental challenges that both market forces and society impose upon transport industry in order to boost the blue and green economy and achieve sustainable development.

1.2.3. Container freight

To be completed

Draft for information only

I.3. Euro-Asian transport flows

At the moment the Eurasian trade is provided primarily by maritime routes.

It should be noted that the term “maritime route” used here actually means the intermodal transport chain containing shipping services from Chinese to European ports, port transshipment and the surface leg executed by rail or truck (or both of them). The sea section of such a route is the longest part of the trip; besides that, the ocean shipping lines often arrange the entire delivery and value added services acting as intermodal transport operators.

The railway links between China and Europe via the Central-Asian countries are the object of the growing interest since they can offer transport products competitive under certain conditions. The main advantage of rail connection is faster delivery. Several multinational companies have started operating regular container block trains using different routes across the EATL zone. Some of the successful services of this kind are described in section **.

However, the land bridge cannot—and likely will never—compete (in full meaning of the word) with the maritime option because the potential throughput of overland routes is limited by 1–2 percent of what is carried by sea. But it may well establish itself as a complement to shipping to increase the reliability of time-sensitive supply chains involving manufacturing production sharing, such as high-value components in the automotive or computer industries.

I.3.1. Maritime routes situation

As it was mentioned, maritime transport is the dominating mode in the Euro-Asian trade.

Partially it reflects the general leading position commercial shipping holds in global trade thanks to its incomparable economies of scale and punctual regular services highly valued in modern supply chains.

On another hand, maritime transport shows high market flexibility that helps the industry to survive through the crisis and keep the customers loyal. At least, three issues should be mentioned in this connection: slow steaming, shipping alliances and flexible rates.

Slow steaming concept- reduced vessel speeds to save fuel and cut costs -adopted now by the majority of shipping lines is one of the important features that changed the maritime business since the 2009 crisis.

According to Clarksons Research, prior to implementing slow steaming, a typical structure for a service from the Far East to Europe included eight ships in operation to maintain weekly calls over a period of 56 days for full rotation (28 days for one leg). With the implementation of slow steaming, the number of operated vessels had increased to ten to maintain weekly calls, while transit times increased to 70 days for a full rotation (35 days for one leg). At the same time, such a speed reduction can impact almost 50% of the bunker cost of a mega-containership and a little bit more on the cost of a 5,000 TEU's ship. Besides, slow steaming obviously decreases environmental pollution which is a good news for “green-focused” customers.

Many shippers accept a shift to slow steaming since decreased tariff seems very attractive under the crisis pressure. However, others with more expensive merchandise oppose the practice due to increased pipeline inventory associated with longer transit times.

There is no generally accepted opinion about the future of slow steaming. But anyway it gives a chance for surface rail operators to offer new services to customers who believe that slow steaming parameters are not acceptable for their supply chains.

Figure 2.1. China forwarders freight index, China-Europe trade lane, 2010-2016

Source http://en.shippingchina.com/scfi/index/detail/line_id/3/date1/2010-01-01/date2/2016-01-01.html

Shipping alliances creation is the market trend that reflects the market players' intention to establish the sustainable large-scale units that will be able to optimize the participants' assets utilization and services on the main trade lanes. Vessel-sharing within the alliance helps the carriers to increase service frequency without introducing extra vessels. Rate "harmonizing" within the alliances, although legally prohibited, is also said to take place.

At the moment there are four main container carrier alliances approved by the regulators in EU, US and China: 2M, Ocean 3, CKYHE and G6¹. These structures control more than 70% of the cargo volumes moving in the major east-west trades.

The exact impact of this new alignment of the major container ship operators has yet to be fully assessed. Shippers are advocating greater scrutiny and the need to conduct reviews to determine how the alliances are impacting on the industry. But anyway the alliances seem to be the flexible

¹The four alliances mentioned include the following carriers: 2M - Maersk and Mediterranean Shipping Co., Ocean 3 - CMA CGM, United Arab Shipping Co. and China Shipping, CKYHE - Cosco, "K" Line, Yang Ming, Hanjin, Evergreen, G6 - APL, MOL, Hyundai Merchant Marine, OOCL, NYK Line, Hapag-Lloyd.

instrument that maritime container carriers will use on the East-West trade lane to strengthen their market position.

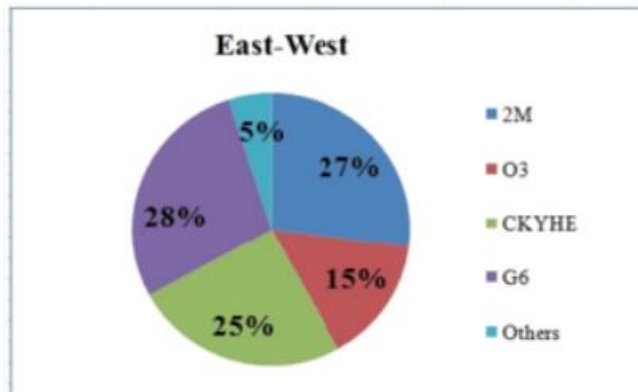

Figure 2.2. Market share of alliances on the East-West trade lanes (Source: <https://www.flexport.com/blog/what-are-ocean-alliances>)

Flexible rates is one of the main market instruments of ocean container carriers. Their prices promptly reflect the changes of the market situation thus keeping the business competitive. The crisis period illustrates that very well. Figure 2.3 shows the dynamics of the Shanghai – Rotterdam container rate from December, 2011 to September, 2013. In the beginning of the period the rate per 40ft container increased from about \$800 up to \$3800 during the 4 months period and then fell down to \$2300 in the next 6 months following the market conjuncture.

Figure 2.3. Shanghai – Rotterdam container rate December, 2011 to September, 2013 (USD per 40ft container). Source: Drewry

The EATL routes in their competition with maritime routes can't show such a flexibility. National railway companies operating on the Eurasian lanes have to follow the tariff agreements and sometimes get the rate change approval from the governmental agencies - which is usually a long enough procedure which is not keeping pace with market changes.

The above shown example also demonstrates that simple comparison of average rates on the EATL routes and on maritime routes that is often discussed does not show the actual picture. It should be recognized that in any case maritime operators react to market fluctuations much faster and more accurate than the railway enterprises.

1.3.2. EATL main routes general overview

During the stage I the EATL project had identified a strategy for the development of Euro-Asian Transport Links, taking into account the major routes along the four main Euro-Asian Corridors that had been previously agreed upon at international level and that represent an extension of the Pan-European Transport Corridors further eastwards. It was also decided, on the one hand, that major routes along these corridors should encompass intermodal aspects, including transshipment points, and, on the other hand that border crossing problems should be addressed.

The project had identified the rail, inland water and road transport linkages that are of central importance in tackling the following interrelated problems:

- to develop transport options alternative to maritime transport between Asia and Europe;
- to better connect the landlocked countries of Central Asia and the Caucasus with the global markets;
- to improve conditions for trade within EATL area itself, primarily – in the Central Asian region.

The identified EATL routes therefore not only aim at improving connectivity amongst EATL countries, but also at connecting the EATL with other existing transport networks in Europe and Asia. Among them are the Trans-European Transport network (TEN-T network) in EU-28, the Pan-European Transport Corridors (PECT), the TRACECA and the rail and road networks in Asia.

The nine rail and nine road routes constitute the core infrastructure network for the transport links between Europe and Asia across Central Asia and the Caucasus. The routes stretch over more than 10 000 kilometers in the East-West direction, and cross over 15 countries.

Specifically, the EATL rail routes extend the Trans-European Railway (TER) network eastward and connect it with the Trans-Asian Railway Network (TAR).

The EATL road routes connect the Trans-Asian Highways (TAH) with the TEN-T routes. Many of the EATL routes also coincide, either fully or partially, with other road networks and corridors, such as the TRACECA, PECT, the six Central Asia Region Economic Cooperation Program (CAREC) corridors, and the Organization for Cooperation of international Railways (OJSD) rail corridors.

As the quality of physical infrastructure of the EATL routes is uneven and gaps in the network exist, the EATL project had identified and prioritized infrastructure investment needs to close existing gaps as well as upgrade and modernize infrastructure, equipment and facilities along the routes (i.e. electrification of railways, building and upgrading container depots or intermodal terminals).

1.3.3. EATL rail routes and railway transport

Out of the nine EATL rail routes, six are in the East—West Direction, and three in the North—South direction. The rail routes 1 and 2 are already used by regular or ad-hoc freight trains connecting Asia, East Russia and Europe.

The EATL **Rail Route 1** (known also as the Trans-Siberian route) is over 10 000 km long, its branches stretching from the eastern borders of the EU (Finland, Hungary, Poland, Lithuania) to the Russian Pacific port of Nakhodka and the Russian-Chinese border. Route 1 extends the Pan-European Transport Corridors (PETCs) II, V and IX eastwards. Its principal advantages include a small number of border crossings, the electrified traction and the uniform (1520 mm) gauge. Parts of the route situated within the European part of the Russian Federation belong to the E-rail and E-combined transport networks. Most of the route is also part of the TAR network. At present, Route 1 provides the backbone for the long-distance surface container transport between Europe and East Asia. The capacity of Rail Route 1 in the eastern part of Russia is limited; at the moment it is planned by the Government of Russia to increase it and to modernize the Trans-Siberian railway having in mind not only the Euro-Asian traffic but the socio-economic development of the entire region.

EATL **Rail Route 2** spans over more than 8 000 km from the eastern borders of the EU with Belarus and Ukraine across the Russian Federation, Kazakhstan and Eastern China to the ports of Lianyungang and Shanghai. Route 2 extends PETCs II and IX towards Asia with most parts of this route belonging to the TAR network. It coincides with Route 1 on the sections between the EU borders and the city of Yekaterinburg in central Russia. Compared to Route 1, there are some disadvantages: firstly, the broad 1520 mm gauge changes at the Kazakh-Chinese border to the 1435 mm standard prevailing in China; secondly, sections of Route 2 have not been electrified; thirdly, there are two additional border crossings and, lastly, the capacity of the section between Kazakhstan and the Chinese ports is limited. *Уточнить*

The main branch of the EATL **Rail Route 3** leads from the south-eastern EU border (Hungary-Romania) to the Lianyungang and Shanghai ports. Route 3 extends PETCs IV, VIII and IX as well as the TRACECA to Eastern China; significant parts of the route belong to the TAR network. Route 3 includes two ferry crossings, from Constanta on the Romanian Black Sea coast to the Georgian ports of Batumi or Poti and from the Azerbaijan port of Baku on the Caspian Sea to the Aktau port in Kazakhstan. Before reaching China, Route 3 and its branches pass through a significant number of countries and border crossings; gauge changes are necessary at the borders of EECCA countries with China and Romania.

The EATL **Rail Route 4** provides an alternative link between South-Eastern Europe and the Lianyungang and Shanghai ports, passing through Bulgaria, Turkey, Iran, Uzbekistan and Kazakhstan. It provides an extension to PETCs IV, VIII, X and the TRACECA route to the Chinese seaboard, also with parts of the route belonging to the TAR network. There are two limitations to that route: there are two gauge changes (Iran-Turkmen border and the Kazakh-Chinese border) and large sections of Route 4 have not been electrified.

The EATL **Rail Route 5** connects northern Europe to Iran, extending from the Finnish-Russian border southward to the Caspian Sea and terminating at the port of Bandar Abbas in the Persian Gulf. Almost the entire route is part of the TAR network. For the time being, the capacity of Route 5 is limited by the bottlenecks on the Iranian side of the Caspian Sea where major installations in the Anzali port and Rasht remain incomplete. When the construction work is completed, Route 5 could significantly reduce freight transport times between Iran and the EU.

The EATL **Rail Route 6** provides an alternative connection between the eastern borders of the EU (Hungary, Poland) with Russia's Pacific coast, while moving across Ukraine and Russian Federation (south of Route 1) towards the port of Vladivostok as well as traversing briefly the Kazakh territory. Route 6 provides an extension of PETCs III, V and IX towards the Pacific Ocean. Again, parts of the route belong to the TAR network.

The EATL **Rail Route 7** provides an alternative connection between the EU and the Lianyungang and Shanghai ports, passing through the territory of Ukraine, the Russian Federation, Kazakhstan, Uzbekistan and China. It extends PETCs III and V given that the whole route belongs to the TAR network. **Large sections of Route 7 on the Kazakh, Uzbek and Chinese territory are not electrified.**

The EATL **Rail Route 8** passes from Poland to Ukraine, southern Russia, Georgia and Azerbaijan to the Iranian border at Astara. Thus it provides another extension to PETCs III and V with most parts of the route belonging to the TAR network.

The EATL **Rail Route 9** provides a connection from the northern Europe through the Russian Federation to Central Asia (Kazakhstan, Uzbekistan and Tajikistan). Significant parts of the route belong to the TAR network. **Since long sections of Route 9 are not electrified,** the capacity of the route is subject to limitations.

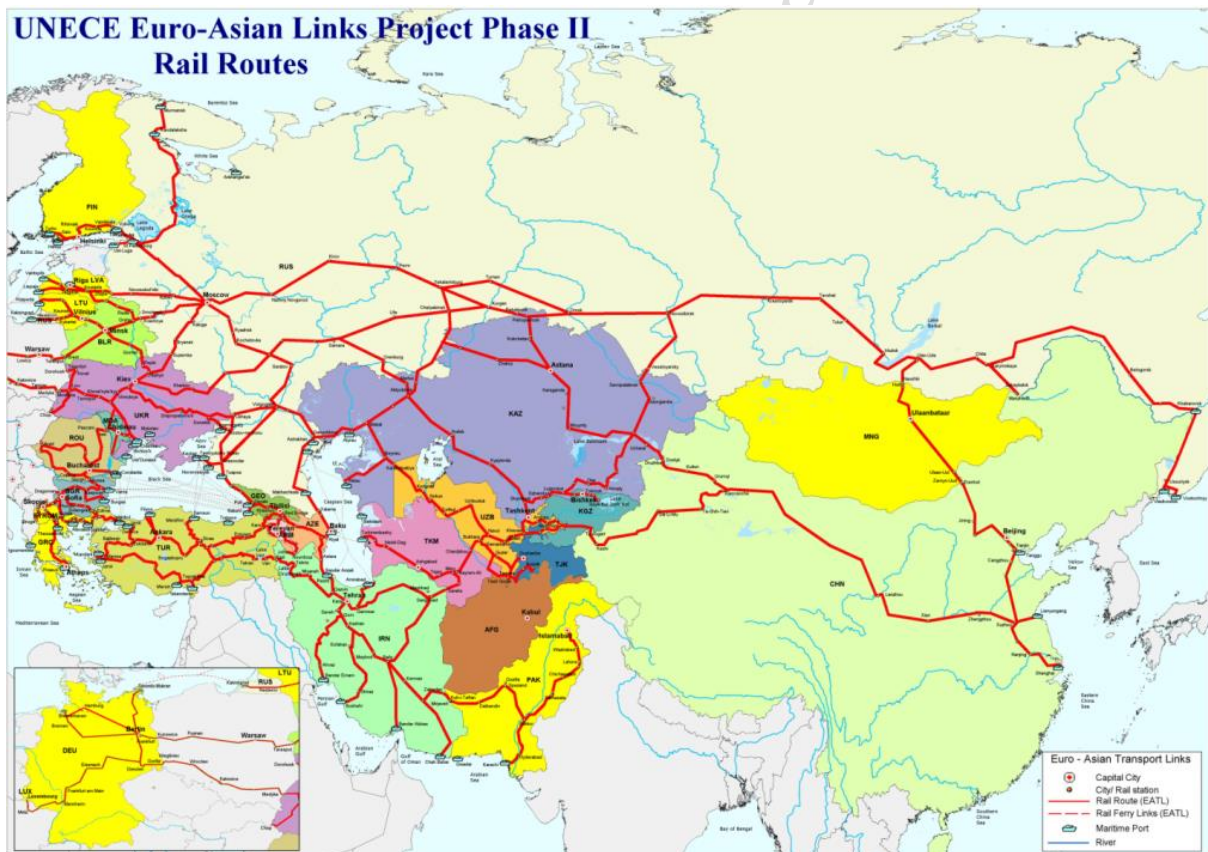

Figure 2.5. Scheme of EATL Rail Routes

Table2.2. EATL Rail Routes

1	“Trans-Siberian Railway, Northern Road”
	West (N and E EU (Finland, Latvia, Lithuania, Poland, Hungary)) to East (Russia Pacific)
	Countries crossed ²² : Russia, Belarus or Ukraine
	Number of gauge changes: 0
2	“Trans-Siberian Railway, Southern Route”
	West (N and E EU (Finland, Lithuania, Poland, Hungary)) to East (China)
	Countries crossed: Ukraine, or Belarus, Russia, Kazakhstan, China
	Number of gauge changes: 1 (Kazakhstan/China)
3	West (SE EU (Hungary, Romania, Bulgaria) through Caucasus and Central Asia to East (China)
	Countries crossed: Moldova, Turkey, Georgia, Azerbaijan, Armenia, Turkmenistan, Uzbekistan, Tajikistan, Kyrgyzstan, Kazakhstan, China
	Number of gauge changes: 1 (Kazakhstan/China)
	Number of ferry crossings: 2 (Caspian and Black Sea)
4	“Southern Silk Road” or “Trans Europe-Asia Route”
	West (SE EU (Bulgaria) through Iran and Central Asia to East (China)
	Countries crossed: Turkey, Iran, Turkmenistan, Uzbekistan, Kazakhstan, China
	Number of gauge changes: 2 (Iran/ Turkmenistan, Kazakhstan/China)
5	North (N EU (Finland)) through Caucasus and Central Asia to South (Iran)
	Countries crossed: Russia, Azerbaijan, Iran, Turkmenistan, Kazakhstan, Uzbekistan
	Number of gauge changes: 1 (Kazakhstan/China)
	Number of ferry crossings: 1 (Black Sea)
6	West (E EU (Hungary, Poland)) to through Central Asia to East (Russia Pacific Coast)²³
	Countries crossed: Ukraine, Moldova, Russia, Kazakhstan
	Number of gauge changes: 0
7	West (E EU (Hungary and Poland)) through Central Asia to East (China)
	Countries crossed: Ukraine, Kazakhstan, Uzbekistan, China
	Number of gauge changes: 1 (Kazakhstan/China)
8	North (N and E EU (Latvia, Poland and Lithuania)) through Caucasus to South (Azerbaijan, Iran)
	Countries crossed: Ukraine, Russia, Georgia, Azerbaijan, Iran
	Number of gauge changes: 1 (Azerbaijan/Iran)
9	North (N EU Finland) and Baltic Russia) through Central Asia to South (Central Asia)
	Countries crossed: Russia, Kazakhstan, Uzbekistan, Tajikistan
	Number of gauge changes: 0

Kazakhstan and Uzbekistan, the largest economies in the Central Asian region and the countries with the most developed rail networks, carry the greatest volumes of freight transported by rail in Central Asia. The rail routes of the region going primarily via these countries serve two complementary purposes: to support the Central Asian countries’ trade with Russia and Europe or with China and to provide opportunities for Euro-Asian transit trade.

Distance is one of the main factors influencing the modal choice. The land route from the North-Western Xinjiang Uygur region of China to destinations in Germany exceeds 7 thousand kilometers. The distance between Almaty (Kazakhstan) and major economic centers in China is over 4 thousand kilometers which compares with crossing the United States from coast to coast.

Taking into account the typical distances on the EATL network and the absence of the inland water routes railways should be the dominating mode developing very fast. Unfortunately, the EATL railways face the common problem – national borders.

These borders do not only cause the delays for border-check and customs formalities. If so, the interruption and the fragmentation of the railway traffic could probably have been successfully removed. But the existence of national borders separates national railway systems which, in turn, leads to fragmentation of railway services.

Different technological standards (including different gauge), different types of electric power traction, different tariff systems, different management principles, uneven quality and capacity of network sections and, finally, the contradictory economic interests of neighboring railways, all brought together, create a serious problem of railways interoperability. It is enough to say that the European railway reform carried on for 15 years within the integrated economic environment and aimed to solve the same problem is far enough from successful ending.

In spite of that numerous logistic companies operate Euro-Asian railway services using the principle advantage of the surface route – shorter lead time in comparison with maritime routes. Some of the cases are described in the next paragraph.

Railway container services across the EATL routes

COSCO Logistics. COSCO Logistics, the largest 3PL in China uses the routes shown in the Figure 2.6. The commodities transported include equipment, tools and building materials for cement production, electrical power station equipment including capacitor set, capacitor voltage transformer substation, and monitoring system and finally well drilling, logging, and well cementation for Kazakhstan oil fields. Currently, COSCO is examining other options with combination of sea and rail transport for transportation between China and Europe. One of the options is for the cargo to enter Europe through the port of Piraeus in Greece and then be transported by rail to central and northern Europe. [IDWP#5]

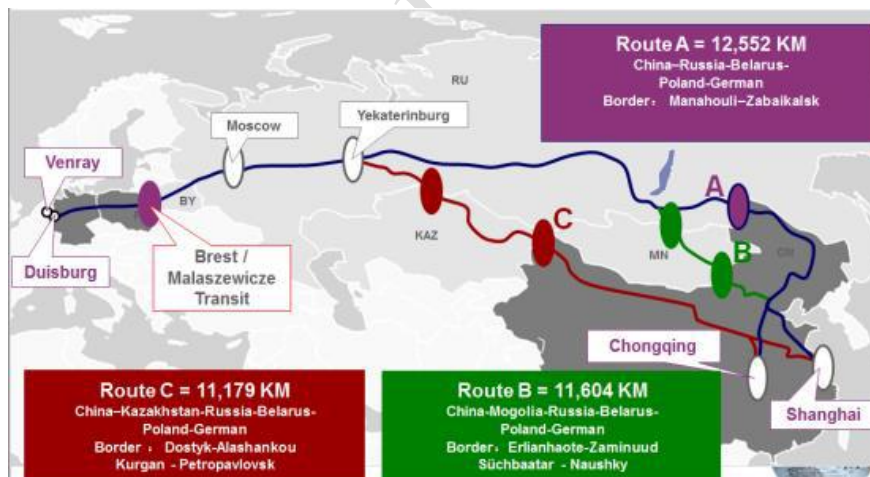

Figure 2.6. COSCO Logistics railway routes

DHL. Deutsche Post -DHL uses several routes to establish the services from Asia to Europe. Since 2011, DHL has been running a daily intermodal service from Shanghai to Moscow via the

Trans-Siberian Railway. A weekly express freight train service was launched in 2013 from Chengdu in western China, across Kazakhstan to its cargo port in Poland and then in Russia and Belarus by truck or train, with travel time of 12-14 days. The transported products are mainly electronics, machinery, pharmaceuticals and chemicals.

In January 2014 the company introduced the first temperature-controlled rail container service between China and Europe on a year-round basis. In March 2014, DHL Global Forwarding announced the development of rail-based forwarding services on the China-Europe route via a new joint venture called United Transport and Logistics Company (UTLC), which plans to operate door-to-door delivery times of 21 days [IDWP#5].

DB Schenker. In 1973 the company started providing rail services through the Eurasian land bridge by running the first container along the Trans-Siberian railway route. In 2008 the first train with goods between Beijing and Hamburg was launched and in the beginning of 2009 a weekly regular service between Shanghai and Beijing with Hamburg, Nuremberg and Duisburg was offered. The products transported are mainly from the automotive industry, chemical industry and manufactures of household goods. In 2009 in cooperation with the Russian Railways (RZD), DB Schenker Logistics established the Trans Eurasia Logistics GmbH.

DB Schenker operates also in the Northern rail route from Shanghai to Moscow and then to Duisburg through the Trans-Siberian line with a transit time of 18-20 days. In September of 2011 a regular train service began to operate for BMW on the route from Leipzig to Shenyang (eastbound). In November, a daily container train service was launched for this destination exclusively for BMW for automotive components. From 2012 the company offers a weekly service from Chongqing to Duisburg for IT customers. The transport time for a block train to reach its destination in Duisburg is 18 days. Further to this service, in September 2014 the first freight train run from Hamburg to Zhengzhou in China. The duration of the journey is around 17 days and is about 20 days faster than by sea. [IDWP#5].

KTZ Express. KTZ Express, established in 2013 and being the national multimodal transport and logistics company of Kazakhstan Railways (KTZ), provides rail freight services that take 16 days through Kazakhstan territory, twice or thrice less compared to sea shipping. The products transported are pharmaceuticals, farm produce and electronics with a focus on electronic companies that have their plants in Chongqing or to their suppliers such as Foxconn Technology for Apple Inc. and Acer Inc. Industries such as Hewlett Packard and Toyota Tsusho already use this rail route. There is also an interest from Europe for dedicated block train services to Asia for products such as fruit and automotive parts [23]. In October 2014, the company plans a new rail freight service from Shenzhen, Guangzhou, Wuhan and Xi'an to Europe, announced by the Governments of China and Kazakhstan [IDWP#5].

Yuxinou (Chongqing) Logistics Co., Ltd. The Yuxinou (Chongqing) Logistics Co., Ltd. provides freight railway services between Asia and Europe. One of the main services is the Yuxinou train which travels from China via Kazakhstan, Russia, Belarus and Poland to Germany with travel time 16 days. It's one of the weekly services leaving the industrial hub of Chongqing and having as customer electronic companies such as Hewlett-Packard Co., Acer Inc., Apple Inc. and supplier Foxconn Technology Co [IDWP#5].

The Far East Land Bridge Ltd. The Far East Land Bridge is one of the first logistic companies, which provided railway services between Europe and Asia and has its base in Vienna, Austria. In 2007 they started providing two-way container rail services via the Trans-Siberian Railway route and European and Chinese rail networks. The main customers of the company are industries such as BMW, Audi, Volkswagen and Samsung [IDWP#5].

Wuhan-Europe freight trains. The Wuhan-Europe freight train is express cargo train that carries containers between Wuhan and European cities. At present, Wuhan-Europe freight train links Wuhan with over 20 countries, including Germany, Poland, Czech Republic, Russia, Belarus, 5 countries in Central Asia, etc. Besides customized trains and public trains, random trains and LCL services were also provided to serve small and micro enterprises.

In 2014, Wuhan-Europe freight train ran 4 lines, with two passing customs at Alataw Pass, and the other two passing customs at Khorgos and Manzhouli, respectively.

2015 has witnessed the opening of two-way freight trains linking Wuhan with Hamburg and Duisburg in Germany, as well as a “Russia-Manzhouli-Wuhan” timber train. A train linking Wuhan with Minsk of Belarus was launched on Sept. 24, 2015. Besides, the China-Europe freight train links Wuhan with Moscow on Oct. 24, 2015, forming a bilateral flow with the previous “Russia-Manzhouli-Wuhan” timber train.

Figure 2.7. Wuhan-Europe freight trains operation scheme (source – Hubei Government site)

In November 2015, Wuhan Asia-Europe Logistics Co., Ltd signed commerce and trade logistics strategic reciprocal agreement with 12 Chinese and Russian logistics companies. Wuhan Asia-Europe Logistics Co., Ltd. announced on January 5, 2016 that Wuhan freight trains ran a total of 164 shifts in 2015, carrying 14,912 TEUs. The growth rate exceeded 500%, ranking first nationwide. The main cargoes transported are:

- from Wuhan: electronic equipment, automobiles, clothes, general merchandise of companies including Foxconn, Dongfeng, AOC, WISCO, etc.;
- from Europe: plastic floor, plastic compression roller, auto parts, cosmetics, fishing gears, timber, etc.

It is planned that Wuhan-Europe freight train will extend operations westwards and establish offices in countries like France [19].

China Railway Express .China Railway Express Co., Ltd. was founded in 1993 and is based in Beijing, China. The first China – Europe container block train under the family brand “China Railway Express” arrived in Poland. On 8 June 2016 the train set off from station in Chengdu, the capital of the Chinese province of Sichuan, then crossed the territories of Kazakhstan, Russia and Belarus and arrived 12 days later in Warsaw.

The twenty-two carriage train delivered electronics goods and auto parts to the Polish State Railways (PKP) Cargo Terminal in Warsaw. The arrival of the China Railway Express marked the opening of the New Silk Road - a Chinese project to open a new commercial route linking Asia and Europe. At the same time a container block train with Polish goods set off in the opposite direction to China.

OSJD site
http://en.osjd.org/newso/public/en?STRUCTURE_ID=5049&layer_id=5541&refererLayerId=5543&refererPageId=4&id=45

The business model of railway transportation within the described supply chains is currently based on the “corporate” scheduled block trains serving individual shippers and operating from plant to plant (or from the plant to logistic center). These trains support constant guaranteed industrial cargo flows of the selected customers. Most of the examples described in the previous paragraph follow this model.

The next step – introduction of public regular services for customers shipping less than full train loads – is more complicated. To make the business viable and to attract enough traffic the transport operator should contact numerous shippers not only in the origin point, but all along the route. Intermediate stops on the way mean also contracting local terminal operators and probably freight forwarders.

At the moment there are few known services of this type. **Examples?*** Some of them had started as scheduled services but then shifted to the “departure on readiness” regime.

Prospects and opportunities for EATL transit rail routes

In spite of fact that numerous railway services have been introduced or tested on the overland EATL rail routes connecting Europe and Asia (see above), they still play a marginal role for transcontinental transit traffic. Different opinions exist on the future growth of Euro-Asian freight volumes to be captured by these routes (Rastogi et al, 2014) but most of the sources points to the fact that maritime transport will likely remain the dominant mode in the Europe-Asia transport market (no less than 95 percent), at least for some years to come.

There are many causes for low use of the land bridge for transcontinental trade. Some of them can be eliminated or, probably, “softened” in the course of physical improvement of the infrastructure and the institutional reforms. Others (railway costs vs. shipping costs, border procedures, different technical standards on railways) will likely be in place for decades.

Most of the commentators agree that three main factors can influence the development of the overland railway Eurasian services: a) development unified legal regime across the Eurasian railway links b) appropriate choice of the business/commodity segment by railway and logistic operators and c) smart logistic decisions, probably, in synergy with maritime or air transport transportation.

Development the unified legal regime. The principle problem for EATL area is that different legal regimes for rail transportation are in place across it. The majority of the EATL countries are members of the OSJD and party to their legal agreements, such as the SMGS. Others are members of the OTIF and their legal regimes, such as the COTIF/CIM 92, and some are members of both. European countries are also members of the OTIF and contracting parties to

the COTIF/CIM, with some countries – Poland, the Baltic States and several others (9 states in total) being members of both organizations and contracting parties to both legal regimes.

When the railway route lays across countries using different regimes two different consignment notes for rail freight, each based on the respective legal regime, are to be filled in. Railway operators or freight forwarders therefore have to re-write a consignment note when crossing into the territory where the different legal regime applies.

The legal regimes also differ in other important aspects such as liabilities, and therefore increase uncertainty for cross-border rail freight transport crossing EATL countries.

A common CIM/SMGS consignment note has been developed to avoid reissuing of transport documents and in so doing to simplify customs clearance. But, according to DB Schenker, “CIM/SMGS consignment notes in both directions are only used in 26–27 per cent of cases” as not all customs administrations accept the document.

Customs authorities should accept the joint CIM/SMGS consignment note as an equivalent to a transit customs declaration. The benefits of the joint CIM/SMGS are significant for reducing delays in cross-border rail transport as mentioned by DB Schenker – “its use reduces the standing time of rolling stock at borders from three days to 1.5 hours. This considerably increases the competitiveness of rail freight transportation.”

The CIM/ SMGS consignment note is also issued as an electronic document so that it can be exchanged electronically in advance with authorities and other transport parties.

Certain steps are made to change the legal situation in the radical way.

In 2013 a joint declaration expressing willingness to create a common legal regime for rail traffic across Asia and Europe was signed by 37 countries at a ministerial meeting in Genève. The signatories are: Armenia, Azerbaijan, Belarus, Belgium, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Czech Republic, Estonia, Finland, France, Germany, Greece, Italy, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Macedonia, Malta, Moldova, Mongolia, Netherlands, Pakistan, Poland, Portugal, Romania, Russia, Serbia, Spain, Sweden, Switzerland, Tajikistan, Turkey, Ukraine, Uzbekistan.

The aim is to establish 'a unified set of transparent and predictable legal conditions for international rail freight transport “from the Atlantic to the Pacific”, equivalent to the regimes for competing road, air and water transport.

The planned general conditions of transport for Euro-Asian rail transport, known as GTC EurAsia, would include a common consignment note and 'to the extent possible' a single liability regime.

Operators, associations and other stakeholders have been invited to co-operate in the development of GTC EurAsia, which is supported by the United Nations Economic Commission for Europe.

Following the declaration signature, the Group of Experts set up for this purpose by the UNECE has started its work to give substance to this unified law.

Rather than creating law overarching the two legal regimes of the CIM UR and SMGS, or creating autonomous law, OTIF advocates and will defend the establishment of an interface regime between the CIM UR and SMGS, with a common consignment note and a common liability regime. With this

in mind, the validity of COTIF/CIM and SMGS for transport that is governed strictly by their respective rules would not be called into question.

The question of the legal form of the institution intended to support this new instrument is very complex. OTIF believes this should be discussed at the end of the process, as it depends to a great extent on what the law contains. OTIF uses the model of COTIF to propose high-level provisions, giving the sector the responsibility of deciding the precise conditions for applying them.

At the same time, OTIF's concept was opposed by that of OSJD, which called for the creation of a new convention to replace the CIM UR and SMGS.

OTIF and OSJD agreed to set up a technical working group (joint OTIF-OSJD working group in which CIT will also take part) which could start preparing the application documents for the new Euro-Asian legal regime

In any case, it is essential that the provisions of the new instrument are simple and practical and enable rail transport undertakings to develop. If this is not the case, as at present, the parties to the contract of carriage will choose to apply the agreed national law, with all the legal risks this entails. The aim of the developments taking place under the aegis of the UNECE is to avoid this risk.

Choosing appropriate commodities and business segment. The list of commodities suitable for railway transportation in Eurasian trade covers a rather limited market niche which includes high value and small volume goods. Those are goods for which air transport is too expensive, while maritime transport is too slow. Therefore, in the case of products that need to be delivered rather fast and on time, railways offer a good option.

According to [12] the list of such goods includes:

pharmaceuticals

electronic products

IT products

fashion products

footwear

automotive components

tires

specific construction materials

timber and wood

chemicals

fertilizers

white goods

pipes

particular agricultural products

machinery

Cargo not mentioned above is not typically transported by rail and generally does not present good candidate for overland transport. In particular, cheap and bulky products such as raw materials, petroleum products and liquefied gas which form the basis (volumewise) of the cargo flows in world trade are not and probably will not be transported overland between Europe and Asia in reasonably high volumes.

Synergies between railway and maritime transport. Railway+shipping is a typical combination for intercontinental transport and logistics decisions. Currently much attention is devoted to its development.

The main goal of such a synergy is to achieve the most efficient combination of low cost transport (maritime transport) and low travel times (railways).

The strongest synergy between overland and maritime transport occurs in container transportation. In recent decades the containerization of cargoes is developing rapidly due to possibility for easy and fast change of transport modes.

The most developed model of such synergy is the traditional intermodal or “consecutive” modal combination, when the maritime leg is complemented by a railway section of the route.

An example that has gained much attention in recent years is the transport of goods by sea from China to the port of Piraeus (Greece) and then by rail to major distribution centers in Central Europe. This type of transport may be enhanced by further improving the connection and reducing the handling time during the transfer process, between modes.

At the same time, under certain conditions other types of cargo aside from containerized might have strong synergies between overland and maritime transport. Among them are petroleum products, machinery and other manufacturing products, chemicals, building minerals, solid mineral fuels, foodstuffs, agricultural products, crude oil, metal waste and metal products, chemicals and fertilizers. To provide this type of synergy, it is necessary to improve the port infrastructure and access infrastructure from/to hinterland, to synchronize the port operations and to avoid bottlenecks in cargo handling.

For example, the Port of Riga has a strong interoperability between maritime and overland transport for dry bulk cargo from the Russian Federation, Kazakhstan and Central Asian countries. Its maritime infrastructure is fully developed to handle large *Panamax* type vessels, but the rail infrastructure at the port and access to rail infrastructure is not sufficient to receive large amount of dry bulk cargo at the short period of time to allow simultaneous rail-sea handling at the port [12].

The second model of sea-rail synergy is the combination of maritime and railway delivery in parallel commodity flows within a logistic solution known as “faster than sea, cheaper than rail”.

Such a solution allows for more flexibility than shipping and fewer costs than pure rail (or air freight) for time-sensitive shipments. Within this model, unlike the “consecutive” model of sea-rail synergy, the shares of “cheap” and “fast” flows can be regulated. Within these chains rail transportation is used for a minority share freight so as to be able to smooth and reduce their inventory requirements, fill in the “gaps” in market demand or to be fast with some market novelties. This solution is used for time-sensitive supply chains involving manufacturing production such as electronics and auto parts.

According to expert opinions, the following conditions can provide effective and sustainable sea + rail synergy in the logistics chains connecting Asia and Europe:

Asian terminal points should be located in western and central China (for example, as far east as Chongqing),

European terminal points should be located in Eastern Europe (as far west as Berlin)

Guaranteed flow of high-value and time-sensitive cargo (automotive parts, electronics, etc.) from one shipper or a limited group of shippers as a basis for sustainable regular service.

Railway reforms in EATL countries

The end of the 20-th and the beginning of the 21-st century is the period of global railway reforms. The general aim of these reforms is to make railway industry competitive with road transport under the current economic conditions.

“Traditional” state-owned railways with their monolith opaque structure and monopolistic business approach usually fail to meet the requirements of modern logistic market and supply chains. They are not flexible enough, their tariffs are not market-oriented, service quality is poor. The picture can be added by unsatisfactory punctuality of traditional railway services. This is not a surprise that railways in almost all the economics were losing market in favor of road transport in spite of higher costs and bad environmental reputation of the trucking industry.

One of the most demanded services of railways in modern supply chains, including transcontinental, is transportation of containers (and other intermodal units – contrailers and swap-bodies) by block trains on regular basis. To provide this service certain technological level is obligatory, but not enough.

To provide competitive rail-based intermodal services the independent entity should exist that will specialize on this particular activity. This entity should be able to:

- make free deals with freight forwarders, terminal operators, trucking companies, logistic providers to subcontract additional services (or, in turn, to be subcontracted in the third party's business);
- provide cost-based competitive tariffs and have the opportunity to change them according to the market situation;
- make arrangements with the infrastructure operators about routes and schedules necessary to design the competitive service;
- undertake all the mentioned above not only within the borders of the national railway, but on the cross-border basis as well.

In other words, effective long-haul container railway service developing on their own economic basis without the artificial support from outside needs a liberalized market-oriented environment across the railways all along the entire route. Such an environment can be created in the course of the railway structural reforms.

This section contains the brief overview of the railway reforms progress in EATL countries.

For the purpose of this review all the EATL states can be divided into several groups.

The first group is formed by the EU member states which follow the EC railway reform directives also known as EC railway packages.

The principle idea of the “European reform model” introduced by the directives is separating the infrastructure management from operations to establish the platform for competition of carriers “on rails”. Besides reaching this main goal the enormous efforts are undertaken to provide the interoperability of national railways and railway operators in technological, economical, commercial and legal aspects.

In particular, the EC railway directives envisage the following **basic** principles that should be implemented by the Member States (MS):

Management independence of Railway Undertakings (RU)

RUs according to EU law means any public or private undertaking the principal business of which is to provide services for the transport of goods and/or passengers by rail with a requirement that the undertaking must ensure traction; this also includes undertakings which provide traction only.

MS must take the appropriate measures to ensure that RU are independent with regards to management, administration and internal control over administrative, economic and accounting matters, thereby holding assets, budgets and accounts separate from those belonging to the State.

MS must also take the necessary action to enable RU to adapt their activities to the market and allow their own management bodies to be responsible for the management of their activities, and to be managed according to principles which apply to commercial companies.

Separation between infrastructure management and transport operations

The body or undertaking responsible in particular for establishing and maintaining railway infrastructure is called Infrastructure Manager (IM).

MS must ensure the separation of infrastructure management and transport operations by keeping separate profit and loss accounts and balance sheets and publishing them individually for business relating to the provision of transport services by railways undertakings and for business relating to the management of railway infrastructure.

Access to railway infrastructure and capacity allocation

The Railway Undertakings will be accorded access to the infrastructure in all other EU MS for the operation of all rail freight services and international passenger services.

Infrastructure capacity is allocated by an independent body, which may be the IM provided it is totally independent of the railway undertakings.

Network statement

Infrastructure management (IM) must publish a network statement containing the following information in particular:

- the nature of the infrastructure which is available to railway undertakings and the conditions for accessing it;
- the charging principles, including likely changes over the next five years;

- the principles and criteria for capacity allocation (characteristics, restrictions, procedures and deadlines).

Infrastructure charges

Infrastructure charges should be set and collected by an independent charging body, generally the IM - provided it is not dependent on the railway undertakings

Regulatory bodies

MS must establish a regulatory body (RB) which is independent of IMs, RUs or any other authority involved in the award of a public service contract. Any RU which considers that it has been unfairly treated or discriminated against may appeal to this body.

Operating licenses

The MS must designate the body responsible for issuing railway operating licences. The licensing authority's decisions are subject to judicial review.

The licensing authority may regularly review the situation, may suspend, revoke or amend the operating license under certain circumstances. RU shall also comply with those provisions of national law which are compatible with EU law with regard to safety, workers protection, customs, etc.

Infrastructure integration to provide competitive freight transportation

MS has to establish international market-oriented Rail Freight Corridors to meet three challenges concerning:

- the European integration of rail infrastructures by strengthening co-operation between Infrastructure Managers on investment and traffic management;
- a balance between freight and passenger traffic along the Rail Freight Corridors, giving adequate capacity and priority for freight in line with market needs and ensuring that common punctuality targets for freight trains are met;
- the intermodality between rail and other transport modes by integrating terminals into the corridor management and development.

Besides that, certain requirements concerning safety provision, accidents and incidents investigation, certification and others are envisaged by the EC railway directives.

Although different EU-member states implement the requirements envisaged by the EC railway packages in their own way and at different pace, considerable general progress is reached in this work and the main development direction is quite clear. For this reason the experience of Belgium, Bulgaria, Croatia, Finland, France, Germany, Greece, Italy, Latvia, Lithuania, Luxembourg, Poland, Portugal, Romania, Spain, is not described in this section².

The second group is formed by the EATL countries that have expressed their intention to join the EU.

² Cyprus and Malta have no railways

Bosnia and Herzegovina, the Former Yugoslav Republic of Macedonia, Montenegro, Serbia, and Turkey are now within the Stabilization and Association Process which precedes the country's accession to the European Union. The political choice made by these countries predetermines the development of railway system restructuring – it is to be designed according to the principles of the EC railway packages described above.

The EU experts regularly evaluate the progress the candidate countries make in their preparation to join the EU, in particular – in the sphere of railway reforms. The results of such observations published in 2013 and 2015 (together with other relevant information) are used in this section.

Bosnia and Herzegovina. The railway network in Bosnia and Herzegovina extends for some 1,017 km. It is based on a standard gauge (1,435 mm) and the majority is single track (92 percent). Around 76 percent of the network is electrified. The only non-electrified part of the railway network is located in the north-eastern part of the country, around Tuzla, but it is important in traffic terms. All lines are single-track, except one section of 87 kilometers of Corridor Vc between Zenica and Dobož.

Prior to 1991, the railways in Bosnia and Herzegovina were a fully integrated part of the former Yugoslavian railways. When Bosnia and Herzegovina became independent in 1991, a new state railway company was formed and soon divided into three regional state owned companies reflecting the ethnic divisions of the country. In 2001, according to a new railway law the railway companies in the Croat and Bosnian parts of the country were merged to create *Željeznice Federacije Bosne i Hercegovine* (TFBH). However, the railway in the RS, *Željeznice Republike Srpske* (TRS), remained separate.

Currently the sector includes two vertically integrated railway companies, and a state level coordinating body, *Bosne i Hercegovine i Bosanskohercegovačke Željeznice Javna Korporacije* (ZBHJK).

Both railway companies linger in a critical financial situation. In both companies the separation of operational functions from infrastructure management has not yet occurred.

Railways of Republika Srpska have not yet adopted their network statements. The opening of the rail market is at an early stage. The railway institutions fall short of staff.

Rehabilitation works on rail tracks are in progress. However, the bottleneck at Ivan Tunnel and Bradina ramp, which prevents the transit of Ro-La (trucks on train) trains and 40ft containers from the port of Ploče, is hampering the development of combined transport.

According to the EU experts [23], preparations in the railways area are at an early stage.

The Former Yugoslav Republic of Macedonia. The rail network of FYR Macedonia is small, with 699km of single track rail—with only 235 km electrified. The main line of Pan-European Corridor X traverses FYR Macedonia from Tabanovce to the capital Skopje to Gevgelija, as well as the branch Corridor Xd from Veles to Bitola to Kremenica (146 km). Along Corridor X the line is electrified. The country is also traversed by Pan-European Corridor VIII. This corridor connects the Black Sea through Bulgaria and FYR Macedonia to Albania and the Adriatic Sea.

International transport accounts for 98 percent of freight transport, most of which is transported through Corridor X.

In 2007 Macedonian Railways (*Makedonski Železnici*; MŽ) was reorganized into two separate joint stock companies—a public enterprise in charge of infrastructure management, Macedonian

Railways Infrastructure (MŢ-I) and a transport company in charge of passenger and freight operations, Macedonian Railways Transport (MŢ-T). This change was part of a broader railway reform program aimed at making the FYR Macedonian rail sector comply with EU directives.

A new set of railway legislation was adopted, that regulated, in particular, general organization of the railway system, principles of access to the railway infrastructure, mechanism the collection of the track fees, methods of assignment of the infrastructure capacities, the network statement preparation, the functions of the independent and autonomous regulatory body, relations between the railway undertakings and the infrastructure manager, financing of the railway infrastructure and other issues. Almost all the requirements of the first EC railway package Directives have been implemented by this legislation.

An independent Regulatory Agency was established in 2009. The network statement is published.

At the same time, high track-access charges and market closure further constrain the income of the infrastructure manager without having resulted in the tangible effects on the state operator or the transport sector as the government had hoped for. The rail market remains closed to licensed EU operators until accession.

According to the EU experts [26], further alignment with the EC railway packages is necessary as the railway market remains closed to competition.

Currently the EBRD is making a loan of up to €145 million to finance the modernization of railway infrastructure in FYR Macedonia and to strengthen the country's regional transport links.

<http://www.ebrd.com/news/2014/ebd-connects-macedonian-railway-corridor-to-turkey-.html>

http://www.seetoint.org/wp-content/uploads/downloads/2012/11/769_fyrom2-taiex-rw-.pdf

http://library.tee.gr/digital/m2476/m2476_evmolpidis.pdf

Montenegro. The rail network consists of 248 km of track only. Of these, 168 km are electrified and there are no double lines. A 167 km main line connects the Port of Bar on the Adriatic city to the capital, Podgorica, and to the border with Serbia with an 83 km second line that connects Niksic to Podgorica and to the Albanian border. Rail lines are standard gauge, with the line to Bar electrified. In general, the terrain is mountainous and the line has numerous bridges and tunnels.

Three rail companies operating in Montenegro are Railway Infrastructure of Montenegro (ŽICG), Railway Transport of Montenegro (ŽPCG), and Montecargo AD. The former rail company, Ţeljeznice Crne Gore (ŢCG), was transformed into a public company in 1989; it was partly privatized in June 2002 as a vertically integrated rail company. In accordance with the Law on Railways, adopted in 2004, ŢCG was replaced by two newly established joint stock companies: ŢICG and ŢPCG. In 2009, ŢPCG was further restructured, by spinning off the freight division and establishing this as Montecargo, which is a fully independent joint stock company.

Concession is offered for infrastructure management and for stations operation. The main regulatory bodies are established. Network Statement is approved and published. In accordance

with the network statement of Montenegro's rail infrastructure manager for 2015, track access charges in Montenegro for all types of trains are EUR 3(including VAT) per train km.

The renewed Railway law was adopted in May 2013aiming at setting a new regulatory framework for managing the railway infrastructure and transport services, defining the competences of the Railway Directorate as the regulatory body, and improving the competitiveness and quality of transport. A five-year business planwas prepared by the Railway Directorate for 2013-2017.

The agreement on border railway transport between Montenegro and Albania was ratified in March 2013.

According to the EU experts [24], the alignment with EU Directives is almost complete.

Serbia. The length of Serbian railways is about 4100 km. The main line goes from North-West to Sowth-East: border with Hungary – Subotica – Novi Sad – Belgrad – Lapovo – Nish. From this point the lines go to Preshevo – Border with Macedonia and to Dmitrovograd – border with Bulgaria. For other lines connect this main rail communication with Croatian, Montenegro, Romanian, and Macedonian borders.

In 2013, the Serbian Parliament adopted the new Law on Railway, which came into force on 30 May 2013. The law represents the framework legislation for this area and replaces the old act on railway that was in force since 2005.According to the Government, the Law on Railway is aimed at introducing the necessary reforms into the country's railway system, opening competition into this sector, improving effectiveness of the country's railway system and integrating it into the market of transportation services and EU railway system.

The Law on Railway had introduced the principle of separation of railway infrastructure from operations. The separation is supposed to be implemented in the form of the separate accounting and, to a certain extent, management of a commercial entity managing infrastructure from a commercial entity managing transport of passengers and goods. At the same time, the Law on Railway does not explicitly prescribe that such separation has to be formally accomplished through the formation of separate legal entities.

Despite the formal separation between railway infrastructure and operations, the railway infrastructure itself remains in the ownership of the Republic of Serbia and represents a so-called good in public use, while the management of the railway infrastructure is deemed to be an activity in the public interest. However, another important novelty is that an entity that manages railway infrastructure no longer needs to be organized in the form of a "public enterprise", a category of legal entities formed by the Serbian state, provinces or municipalities. This opens the way for potential participation of private entities in the management of railway infrastructure.

The network statement is also introduced by the Law on Railway.

The Law on Railway also provides for the preparation and adoption of a periodical National Program on Railway Infrastructure. The program should be prepared and proposed by the Serbian Government and, subsequently, adopted by the Serbian Parliament for a term of five years.

Overall, the Law on Railway appears to represent an important step in the direction of liberalization of the Serbian railway system. However, it is yet to be seen with what degree of efficiency and diligence the important novelties that the law contains will be implemented.

It also remains to be seen to what extent the relevant state-owned railway operator will adjust to the new setting and whether such setting will bring effective liberalization to the market of railway services. According to some initial, informal reactions by the relevant public bodies to the Law, the entire railway network currently in existence should continue to be managed by the relevant state-owned railway operator, while possible new routes and/or existing routes that are potentially found in the future as being no longer viable for use by the state-owned railway operator could be possibly offered to private operators (e.g. new routes could be potentially constructed through a PPP/concession model). If so, the true liberalization of the Serbian railway market may still be some years away.

According to the EU experts [25], open access to the railway market, with transparent track access charges and capacity allocation, still needs to be achieved.

<http://www.kinstellar.com/insights/detail/147/new-law-introduces-reforms-into-serbian-railway-system>

Turkey. The length of the railway network is about 11 000 km. 19% of the total length is electrified.

EATL railway corridors 3 and 4 pass through the Turkish railway network.

Turkish Railways, *Türkiye Cumhuriyeti Devlet Demiryolları* (TCDD), is the public enterprise that operates the public rail system in Turkey. It operates the state railways and several large ports; it also manufactures and repairs locomotives, wagons, and passenger coaches. As the sole train operator in the country, Turkish Railways operates all passenger, freight and suburban trains, including domestic and international departures. There were no separate accounting procedures for its various operations.

Turkish Railways is the largest loss-making state public enterprise in Turkey, although the ports are profitable and cross-subsidize rail transport.

Although the government and TCDD completed an EU-funded programme on restructuring and strengthening the Turkish railway sector in January 2007, no progress was made on implementing EU regulations or national legislation proposed by the project.

The acting law on liberalization of railways does not comply with the EC directives in creating the conditions for a competitive and transparent market where the independence of essential functions is ensured. Legislation on network access was published, but other legal provisions, on issues such as licensing, rolling stock registry and safety, are still not in place which prevents any effective opening-up to the private sector.

The incumbent railway operator, Turkish State Railways, has still not been unbundled as required by law. In its role as infrastructure manager, the company owns and finances rail operations, contrary to the EU requirements. The Directorate-General for Rail Regulation still acts as both the regulatory authority and the safety authority and does not enjoy sufficient independence from the Ministry of Transport.

According to the EU experts [27], further alignment efforts are required.

environment-transport-energy/reforming-turkish-railways.html

Summarizing what was said about the countries of this group it should be mentioned, that

a) certain progress is reached in the course of railway reforms in the mentioned above countries which are following the main provisions of the EC railway directives;

b) in spite of all the positive changes, there are no new entrants in their railway markets which seem to be practically closed;

c) the pace of reform seems to be slower than it was planned which can be explained, besides the rest, by the general economic problems and decreased market demand for rail transportation.

The third group of countries contains the former republics of the USSR: Armenia, Azerbaijan, Belorussia, Georgia, Kazakhstan, Kyrgyzstan, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan. They are united by the common “Russian” railway gauge (1520 mm) and the common heritage of technology and organization of the soviet railway system. Some of these countries still keep this heritage; others had undertaken certain structural reforms aimed to adjusting the railway industry to market conditions.

Armenia. Armenian railways have the 845 km total length. The entire network is electrified. The system is a part of EATL corridor 3.

There were no structural reforms in the Armenian railway industry since the collapse of the USSR.

In 2007, the government of Armenia conducted a tender process for the modernization and operation of Armenian Railways. Russian Railways was the only bidder and established South Caucasus Railway (CJSC) as a wholly owned subsidiary to run the Armenian Railways. On 1 June 2008, South Caucasus Railway officially commenced its modernization and operation program and, as part of the concession agreement, received all the assets owned by Armenian Railways. The concession agreement was concluded for 30 years, with a right of extension for another 20 years after the first 20 years of operation. It means that the structure and the operation model of the Armenian railway system in the foreseeable future will be the copy of those used by Russian Railways.

<http://ppp.worldbank.org/public-private-partnership/library/concession-agreement-transfer-armenian-railway-system-south-caucasian-railway>

Azerbaijan. Currently, the total length of main railroads is 2932 km including 815 km of double-track sections. 1272 km of the total length is electrified. EATL railway corridors 3, 5 and 8 pass through the Azerbaijan railway system.

Azerbaijan Railways (Azerbaijani: *Azərbaycan Dəmir Yolları*) is the national state-owned rail transport operator in the Republic of Azerbaijan that continues to operate as a fully integrated state monopoly. The core railway businesses (infrastructure, passenger, freight, etc.) are operated by this entity. Little progress has been made in terms of competition and privatization. Freight tariffs were liberalized while passenger tariffs remain determined by the government.

It is reported that one of the biggest financial problems was the practice of barter transactions among state entities (i.e. state owned companies did not pay for services in cash), which was banned in 2006. No information on the planned structural reforms is currently available.

<http://www.ebrd.com/downloads/country/strategy/azerbaijan-country-strategy.pdf>

Belorussia. The national railway network consists of 5,512 km, and 874 km of it are electrified. Belorussian railways are the part of EATL corridors 1 and 2. The entire system is operated by

the *Belaruskaya Chugunka* (Belarusian Railway – BR) - the national state-owned railway company of Belarus.

Official documents do not envisage any substantial reforms in the industry that is still “soviet-shaped”. The Belarussian state program for development of rail transport in the period of 2011-2015 provides only for modernization of the sector within the existing model, in which the BR is a government corporation subordinate to the Ministry of Transport and Communications of Belarus. Besides, some legal changes necessary to improve the international operations must be undertaken.

At the same time, the Belarusian scientific community has developed a reform concept that is discussed currently.

The concept provides for a vertically integrated entity. At the central level, management of all railway enterprises should be concentrated in a holding company called Belarusian Railways, which is to be taken out of the jurisdiction of the Belarussian Ministry of Transport and Communications and must report directly to the Council of Ministers.

In turn, five companies will be subordinated to the holding general directorate: a freight company, a passenger company, a locomotive company, an engineering company (repair and maintenance of infrastructure), and an engineering company (design work). Each of these entities should perform the full range of functions supporting its type of transport operations.

The reform concept is radically different from the Russian model and is contrary to some basic principles laid down in the railway directives of the EC described above, in particular – there is no market competition within the proposed system.

http://en.cfts.org.ua/articles/railway_reform_in_belarus_a_special_way

Georgia. The national railway network consists of 1,576 km, and 1534 km of it are electrified. Georgian railways are located on the shortest route between Europe and Central Asia. EATL corridors 3 and 8 passes through Georgian territory.

Georgian Railway LLC (*Sakartvelos Rkinigza*) is the national fully state-owned railway company of Georgia. There were several attempts to involve the railway industry into the market-oriented reforms by privatizing the company.

In the summer of 2007, the government handed over management rights for 99 years to the London-based Parkfield Investment which had pledged to invest \$1 billion into the Georgian railway network over the next decade. But by October 2007 the deal had collapsed.

In 2008 the concession tender was announced and five entities from Kazakhstan, Sweden, USA and Russia expressed their intention to purchase the 100% of shares and invest into the company’s development. But the procedure was suspended by the government without any explanations.

It is reported that the reason of the privatization problems is the strategic position of Georgian railway within the Caucasus region. The government foresees the risk of unpredictable behavior of the entity that could have become the owner.

No information about planned structural reforms is available.

<http://www.eurasianet.org/departments/insight/articles/eav013108a.shtml>

<http://www.forbes.ru/ekonomika/vlast/59658-pochemu-u-tbilisi-poluchilis-reformy>

Kazakhstan. The national railway network consists of 13 431 km, and 3000 km of it are electrified. Kazakhstan railroads are at the crossroad of EATL routes: railway corridors 1, 2, 3, 4, 5, 7 and 9 pass through the country.

The lines used to be under the control of three separate Soviet regional railway administrations, but were unified under state-owned Kazakhstan Temir Zholy enterprise (KTZ), supervised by the Ministry of Transportation and the Ministry of Finance.

The reforms in the industry were undertaken in three stages.

During the first stage (2001-2005) the “social sphere objects” were outsourced, operations were separated from technical maintenance, private capital was attracted to the latter activity.

During the second stage (2004 – 2006) the entities involved in technical maintenance were privatized. Separate directions were established for infrastructure management and operations. Two companies were established: “Lokomotive” (providing the traction services) and “Kaztemirtrans” (wagon fleet operator).

The first two stages envisaged the industry transformations very much alike those in Russia. But later the direction of the reforms was changed.

The third stage which is now implemented envisages the separation of network management and operations. At the same time, the holding will be established under the KTZ control containing the “KTZ-infrastructure” (network management), “KTZ-cargo transportation”, “KTZ-passenger transportation”, “KTZ-manufacturing and repair”. The cargo and passenger carriers will operate their own locomotives and wagon fleets. The government is subsidizing the passenger services and finances the network development. This model is very close to the EU railway industry structure.

Besides other goals, the current development strategy is aimed at winning market position of transcontinental transit. It is also planned to develop distribution centers for transporting goods on the following routes: 1) From East Coast and inland provinces of China to the EU countries (northern corridor TARN); 2) TRACECA corridor - the countries of Central Asia, the Caspian and the Black Sea (South Caucasus, Turkey) and Iran; 3) North-South - Iran, Middle East, India.

<http://sk.kz/news/view/4494/4?lang=en>

<http://www.ktzh-gp.kz/new-ru/index.php>

Kyrgyzstan. The railway network has the total length of 424 km. The railway lines in Kyrgyzstan are the separated dead-end sections entering the country from Kazakhstan in the North and from Uzbekistan in the South. These are the branches of EATL corridor 3.

The state owned company *Kyrgyz Temir Sholu* (Kyrgyz Railways) is the only operator in the industry. The share of railways in the national transport balance does not exceed 4%.

No information about the structural reforms is available.

Moldova. Moldavian railway network has the total length of 1232 km of which 1218 km are 1,520 mm (Russian gauge), and 14 km are 1,435 mm (standard gauge). The entire network that is single track and not electrified. EATL corridor 3 crosses the country.

Calea Ferată din Moldova (Railways of Moldova - RM) is the sole railway operator responsible for passenger and cargo transportation, as well as railway infrastructure maintenance within the country. There were no structural reforms in the industry since Moldova became the independent state.

At the same time, Moldavian railways are in urgent need of fundamental restructuring to provide adequate services and compete with other means of transport which was demonstrated by numerous projects held by international experts teams. Currently the EBRD is providing €52.5 million loan to RM. The loan will be used to co-finance the acquisition of new multi-purpose locomotives and the rehabilitation of rail infrastructure. It will also support a broader reform of the railway sector to improve safety and efficiency. Action plans to restructure the railway sector and to strengthen the institutional capacities in the key areas of environment, procurement and corporate governance will be developed with the EBRD. It is reported that the reform proposals will be based on the principles of the EC railway directives.

<http://www.ebrd.com/news/2014/ebrd-and-partners-put-moldovan-railway-on-track-for-change.html>

<http://www.railway.md/?lang=ru>

Russian Federation. Russian railway system is one of the world biggest; the length of the rail network is more than 85.3 thousand km. Rail is the main transport mode for Russian Federation.

EATL corridors 1, 2, 5, 6, 7, and 8 pass through the Russian territory.

Before 2001 all the railway activities were carried out by the Railway Ministry that combined the functions of political leadership and the economic management in the industry.

In 2001, the government adopted the Railway Structural Reform Programme that set out strategic priorities for the rail industry up to 2010 and beyond with the aim of improving the efficiency and profitability of rail services in Russia, encouraging investment for modernization and creating an effective railway holding company. The reform was developed in three phases.

- Phase I(2001-2002): Ministry of Railways was separated into two entities: the Federal Railway Transport Agency (integrated into the Ministry of Transport) and the Open Joint-Stock Company Russian Railways (*Rossiiskie Zheleznie Dorogi* - RZD). RZD had assumed all assets and business operations of the former Ministry of Railways. The set of relevant legal acts had been adopted;

- Phase II (2003-2005): RZD assets were unbundled along functional lines. RZD subsidiaries were established for passenger services, container transportation, refrigerated transportation, technical service functions. Many non-core businesses were outsourced. Cross-subsidizing of passenger operations was phased out. By the end of Phase II RZD still kept the full monopoly in infrastructure, traction and most transportation businesses;

- Phase III(2006-2011): introduction of competition and private capital. The main feature of this phase is the development of the independent wagon-operating companies. First their share was relatively small; eventually the entire fleet of cargo wagons was transferred to this segment (including the wagons owned before by RZD). The passenger segment was outsourced. Besides that, IPOs and/or privatization of local passenger, repair & construction, and some other subsidiaries was undertaken.

As a result, Russian railway industry had acquired the structure that does not fit neither the European (separation of infrastructure management and operations, competition “on commonly used rails”) nor the American (competition of vertically integrated railway companies “on parallel tracks”) industry models:

- RZD as a single state-owned monopolistic railway carrier, the owner of infrastructure and the long haul locomotives with no wagons in operation. RZD manages and executes transportation, issues waybills and follows the state-regulated tariff;
- more than 1400 wagon operators, mainly – private owned, with the total fleet of 1,6 million railcars offer capacity to customers together with a set of additional services (forwarding, paperwork, relationship with RZD, etc.). Competing on free-price market.

The reform had reached certain positive results. The private capital had entered the industry. About 50 billion USD in comparable prices were attracted in 10 years. That had solved the rolling stock shortage problem and gave good incentives to wagon-building. The first competitive segment in the industry – wagon operating – is successfully developing. Many private wagon operators are ready and eager to develop as full-scale railway carriers.

Obvious success is achieved in the long-haul passenger segment where the carrier company is outsourced and independent operators exist.

On another hand, many problems still exist. There is still no competition in the freight transportation sector. RZD, being the monopolist here, has no incentives to improve services and decrease costs.

As a result, railways are losing freight in favor of road transport. The freight turnover index 2014 to 2007 is 10% for railways and 19% for trucking.

Currently the plans of further industry transformations are being prepared.

http://eng.rzd.ru/statice/public/en?STRUCTURE_ID=23

Tajikistan. Tajikistan railway network is 680 km long with no electrification. The system connects the main urban centers of western Tajikistan with points in neighboring Uzbekistan and Turkmenistan. EATL corridor 3 and 9 enter Tajikistan.

Tajikistan railways are fully owned and operated by the government. No information about the structural reforms is available.

Turkmenistan. Turkmenistan railway network is 4,980 km long. EATL corridor 3 passes across Turkmenistan.

The only railway operator is the state owned company *Türkmen demir ýollary* (Turkmen Railways). The company belongs to the Ministry of Railways of Turkmenistan. No information about the structural reforms is available.

Ukraine. Ukrainian railway network is 22.3 thousand km long; 9.7 of them are electrified. EATL corridors 1, 6, 7, 8 pass through Ukrainian territory.

The Ukrainian Railways are managed by the State Administration of Railway Transport of Ukraine "Ukrzaliznytsia", which was established in December 1991.

Numerous programs of reforms had been developed in Ukraine during in the post-soviet time. In 2006 the government had adopted the concept of the State Program for the Railway reform. The plan had three stages. In 2009 and 2011 the implementation of the Program was postponed; currently it should be realized until 2019. The ideas of the Program are very close to those of the reform implemented in Russia; one principal difference is that in Ukraine there are no plans to get rid of non-profile social oriented objects like it was done in Russia. By now there are no tangible results of the reforms in the Ukrainian railway industry.

Uzbekistan. Uzbekistan railway network is 4200 km long; more than 1600 km is electrified. EATL corridors 3,4 and 9 pass through Uzbekistan.

The national state railway operator, *Uzbekiston Temir Ullari* (Uzbekistan Railways) In 2001 according to the state program of reforming of railway transport was transformed from the unitary state enterprise into the open joint stock company with 100% of state ownership.

The Uzbekistan government with the support of the Asian Development Bank had for a long time investigated the possibilities of the railway reform. In 1997 the railway reform committee was established and the reform plan was published. The plan included certain standard components: outsourcing of non-profile activities and entities, phasing out internal cross-subsidizing, introduction of the international standards of book-keeping, staff optimization. At the same time, the plan did not envisage any measures aimed at competition development.

In 2001 several decrees were adopted pointed at vertical separation of the industry following the Russian reform model. According to these plans, several divisions of the company were converted into joint-stock companies: JSC Uztemiryulkonteyner (container transportation), JSC Yulrefrans (refrigerated goods transportation), JSC Uztemiryulyulovchi (passenger transportation), JSC Uztemirvagon (wagon repair).

<http://railway.uz/en/gazhk/istoriya/>

Summarizing the review of the group of post-soviet countries, it can be noted, that they, in turn, can be separated according to the achieved reforms progress:

- countries that have made certain progress in reforms developing the “Russian” reform model that is not alike neither “European” nor “American” one: Russian Federation and Kazakhstan;
- countries, where reforms are widely discussed and some legal acts are adopted, although practical steps seem to be moderate: Ukraine and Uzbekistan;
- countries, where reforms had not been even seriously planned: Armenia, Azerbaijan, Belarus, Kyrgyzstan, Moldova, Tajikistan, Georgia, Turkmenistan.

Group four includes Asian countries that do not belong to neither of the previous three groups. They are characterized by completely different situation in the railway industry and railway reforms: Afghanistan, China, Iran, Mongolia, and Pakistan.

Afghanistan. Afghanistan railway system consists of two lines:

- 75-kilometre long stretch connecting Mazar-e-Sharif with the border of Uzbekistan which was open in 2011. According to studies conducted by the Afghan Government, the railroad is a success and has helped to ease a bottleneck of goods at the Hairatan dry port on the Uzbek-Afghan border. The line serves as a major hub for almost 50 per cent of the country’s total

imports (before the line was opened the goods were reloaded to trucks at the border). This line operated by Uzbekistan railways is the connection to EATL corridor 3;

The - 6 km long line between the Turkmen border and Towraghondi.

The railway activities in the country are controlled by the Afghanistan Railway Authority (AfRA) established in 2015. Its task is to develop, design and maintain railway network in Afghanistan.

Actually, the railway industry in Afghanistan is at the starting point of its development.

<http://mopw.gov.af/en/news/afghanistan-railway-authority-afra-is-a-newly-established-organisation-which-is-responsible-to-develop-design-and-maintain-railway-network-in-afghanis>

<http://www.centrasia.ru/newsA.php?st=1287260880>

China. China has the second longest railway network in the world (121 000 km) with 24,100 km of multiple track and 18,900 km of electrified lines. The Chinese railway system is the starting part of the Eurasian railway corridors 2,3,4,7.

The railway sector in China has undergone several major rounds of reform and institutional restructuring since 1986. The most radical transformation was undertaken in 2013 when China's Ministry of Railways (which used to be one of the last world railway ministries combining political management and operations) has been split into three. The railway planning and policy making functions were entrusted to the Ministry of Communications (MOC), other administrative functions rest with a newly established State Railways Administration (SRA), while commercial activities passed to the new China Railways Corporation (CRC).

CRC is a state-owned company reporting directly to the central government. It is financed by the Ministry of Finance and regulated by MOC and SRA.

CRC transports passengers and freight, and is responsible for operating and managing the country's rail network. CRC drafts investment plans for railway construction, is responsible for implementing railway projects and is accountable for safety.

In other words, the absolute monopolist position that historically belonged to the Ministry of Railways, is practically preserved within the CRC.

Incorporation of the railway sector into MOC is part of the reform scheme aimed at building up a comprehensive national transport system. With simultaneous handing down of power by the central government, overall planning is expected to make railway construction more economic, with better use of human and material resources. The government expects railway operations to become more efficient, with stricter work standards set and policed by SRA, and improved services.

At the same time, some experts [28] argue that the transformation from the mixed-function Ministry of Railways to China Railway Corporation will not necessarily lead to better railway management. It should also be mentioned, that CRC inherited some problems from the Ministry of Railways, in particular – enormous debts that amounted to about 400 billion USD, internal cross-subsidizing of social-sensitive passenger services, etc.

<http://www.railjournal.com/index.php/policy/china-implements-radical-railway-reform.html>

<http://www.tandfonline.com/doi/abs/10.1080/10670564.2015.1030957?journalCode=cjcc20>

Iran. Iran railway network is about 12000 km long with the standard gauge; 148 km are electrified. Iran is crossed by the EATL corridors 4, 5 and 8.

Republic of Iran Railways (RAI) is the state organization in charge of railway activities.

After the sanctions against Iran were dropped in 2016, the country has good opportunities to upgrade and modernize its railway network. According to the plans, by 2025, existing lines will be electrified and double-tracked and about 12,000 km of new lines will be built, doubling the size of the network.

No information about the structural reforms is available.

<http://www.globalconstructionreview.com/markets/how-islamic-republic-set-become-land-br8i8d8ge/>

Mongolia. Mongolian railway network is 1815 km long. EATL corridor 1 reaches Mongolia from the North.

The main player in the sector is the Ulanbataar Railways company (UBTZ) founded in 1949 and jointly owned by the Government of Mongolia and the Russian Railways. It is responsible for infrastructure and operation on the main line between the Russian and Chinese borders.

In 2008 the Mongolian Railway Company (MTZ) - 100% state-owned joint-stock company - was established in order to manage the development of national railways and to act as a recipient of the foreign aid.

Besides that, the Boroo Tumur Eruu Gol, an iron ore company, owns 85 km of racks and 3000 wagons hauled by the UBTZ on the UBTZ network.

The State policy on railway transportation adopted in 2010 envisages the liberalization of the freight market and modernization of the regulatory framework. It is expected that the private sector will be involved into the industry development.

https://books.google.ru/books?id=kjWCwAAQBAJ&pg=PT12&lpg=PT12&dq=mongolian+railway+reform&source=bl&ots=I4WCZZY0aV&sig=TAAtCzUwHfpjh7cmEBGkAXFKvodA&hl=ru&sa=X&ved=0ahUKEwj3m67_pvbOAhVmEJoKHX2GC3kQ6AEIJDAB#v=onepage&q=mongolian%20railway%20reform&f=false

<https://www.legendtour.ru/rus/mongolia/informations/ubzd.shtml>

Pakistan. The total length of Pakistan railway network is 7,791 km of track all across Pakistan, stretching from Torkham to Karachi. Pakistan Railways used to have a mixture of gauges, including 1,676 mm, or "Indian gauge" track; 1,000 mm; and 762 mm narrow gauge. Currently only the Indian-gauge railway lines are operational. EATL corridor 4 reaches Pakistan from the West.

Pakistan Railways is the national state-owned railway company of Pakistan. It is reported that the company constantly faces serious economic problems; some experts even say "it is dying a slow death". At the same time, no serious efforts to restructure the system are undertaken. Attempts to carry on the privatizing of the Pakistan Railways were rejected by the court.

1.3.4. EATL road routes and road transport

The EATL **Road Route 1** starts on the eastern borders of the EU with Belarus as well as the Russian Federation and continues across the Russian territory to the nation's Pacific coast, extending PETCs II, V and IX. Parts of the route belong to the AH network. It runs parallel to the Trans-Siberian railway. The uneven quality of road infrastructure implies that Route 1 is unlikely to be used widely for transcontinental trucking or passenger car trips, especially during the winter months.

The EATL **Road Route 2** is parallel to the Rail Route 2. It extends PETCs II and IX and almost the whole route belongs to the AH network.

The EATL **Road Route 3** starts on the eastern borders of the EU with Ukraine and ends on the Chinese seaboard (Lianyungang and Shanghai ports), passing through the Ukraine, Russian Federation, Kazakhstan, Kyrgyzstan and eastern China. Route 3 extends PETCs II, IV, V, VIII and IX eastward and parts of the route belong to the AH network. Altogether, there are eight border crossings between the EU points of origin and final destinations in China. The road quality varies significantly, especially in Central Asia.

The EATL **Road Route 4** connects South-Eastern Europe to the Lianyungang and Shanghai ports, passing across Romania, Georgia, Azerbaijan, Kazakhstan, Uzbekistan, Kyrgyzstan and eastern China. It provides an extension to PETCs IV, V and IX. Route 4 involves two Ro-Ro ferry crossings (from Romania to Georgia and Azerbaijan to Kazakhstan) and eight border crossings. The quality of the route is uneven, changing from a broad four-lane highway to a narrow two-lane road in some parts.

The EATL **Road Route 5** connects South-East Europe to the Lianyungang and Shanghai ports, starting on the Serbian-Bulgarian border and continuing through Bulgaria, Turkey, Iran, Afghanistan, Uzbekistan and Kyrgyzstan. It extends PETCs IV, V, VIII and IX. Significant parts of the route belong to the AH network. There are eight border crossings and the road quality varies significantly in Central Asia.

The EATL **Road Route 6** connects northern Europe to Iran, extending from the Finnish-Russian borders southward to the Caspian Sea and terminating at the port of Bandar Abbas in the Persian Gulf. Almost the whole route belongs to the AH network and it runs in parallel to the EATL Rail Route 5.

The EATL **Road Route 7** connects the Murmansk port on the northern shore of the Kola Peninsula (in the proximity of Finland and Norway) with the Odessa port in southern Ukraine while passing through northwest Russia and Belarus. Between St Petersburg and Odessa, Route 7 coincides with the PETC IX.

EATL Road routes are shown at Figure 2.8 and table 2.3.

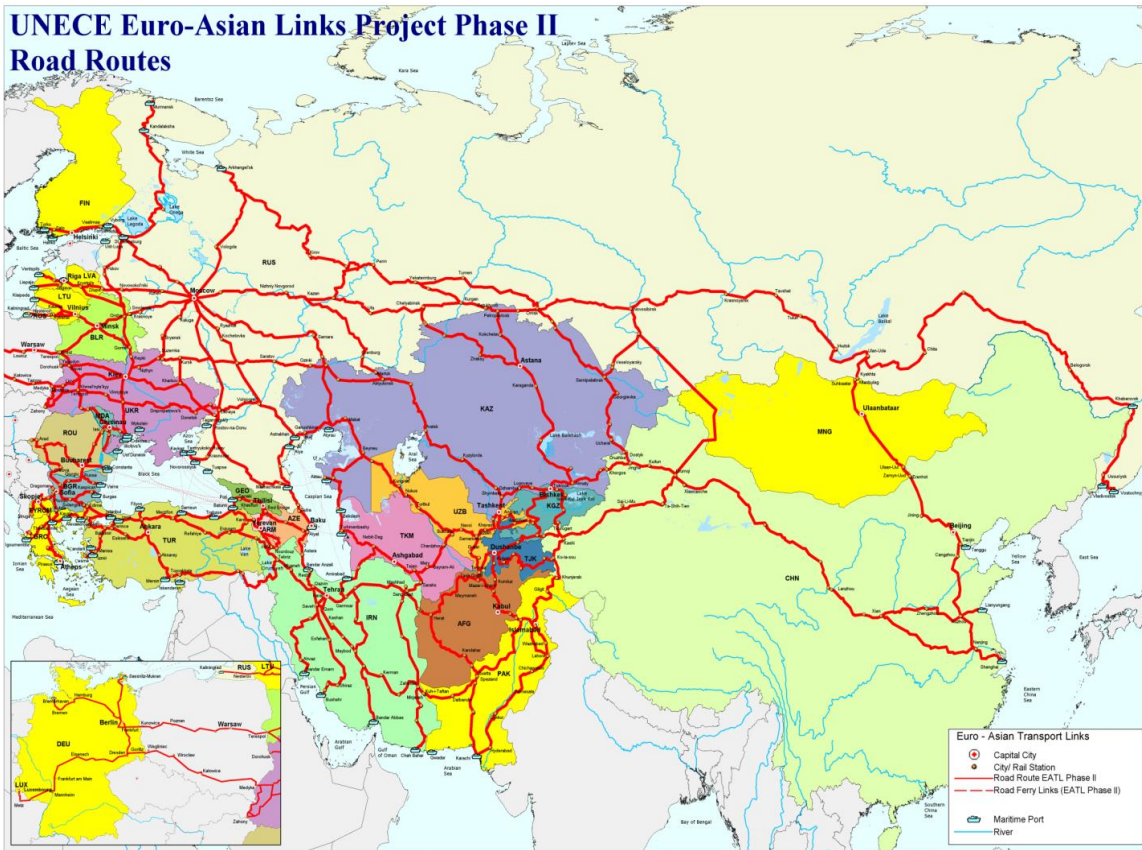

Figure 2.8. Map of the EATL road routes

Table 2.3. EATL road routes

1	West (N and E EU (Finland, Latvia, Lithuania, Poland, Hungary)) to East (Russia Pacific and connects to China and Mongolia – Parallel to Trans-Siberian-Railways Countries crossed: Russia, Belarus or Ukraine
2	West (N and E EU (Finland, Lithuania, Poland, Hungary)) to East (China) Parallel to Trans-Siberian-Railways with branches to Kazakhstan and Kyrgyzstan Countries crossed: Ukraine, or Belarus, Russia, Kazakhstan, China
3	West (E EU (Poland, Hungary) to East (China) Countries crossed: Ukraine, Russia, Kazakhstan, Kyrgyzstan, China
4	West (SE EU (Bulgaria) to East (China) Countries crossed: Georgia, Azerbaijan, Kazakhstan, Uzbekistan, Kyrgyzstan, China Number of ferry crossings: 2 Ro-Ro ferry crossings
5	West (SE EU (Bulgaria and Slovakia) to South (Iran) and East (China) Countries crossed: Turkey, Iran, Afghanistan, Kyrgyzstan, Tajikistan, Uzbekistan
6	North (N EU (Finland)) to South (Iran) Countries crossed: Russia, Azerbaijan, Iran, Kyrgyzstan, Turkmenistan Number of ferry crossings: 1 Ro-Ro ferry crossings /Caspian Sea
7	North (N Russia) to South (Ukraine) Countries crossed: Russia, Belarus and Ukraine
8	North (NW (Russia)) to South (China) Countries crossed: Russia, and China
9	North (Central Russia) to South (China) Countries crossed: Russia and China

Draft for information

The role of road transport varies significantly across the EATL countries. In the European Union (EU 28) road transport accounts for about 75% of total freight turnover. At the same time, in Central Asian region the share of international transportation by trucks as compared with rail is lower in all Central Asian countries (with the exception of Kyrgyz Republic). Here it **accounts on average for less than 6 percent. Уточнить***

In European countries shippers prefer truck due to relatively short distances (even in international haulage), perfectly developed road network and high logistics quality and flexibility offered by road transport companies operating on the high competitive trucking market.

In the Asian part of the EATL region distances are much higher while the quality of the roads is uneven and many operators are not enough qualified and reliable.

Nevertheless the importance of road transport is increasing practically everywhere, in particular for regional and cross-border connections. The geography of the most heavily used routes underlines the importance of the west-east routes to and from China, but also the north-south corridors extending through Uzbekistan to and from Afghanistan, the Islamic Republic of Iran, and the Russian Federation.

Local cross-border market is served by small individual companies with old trucks or local market traders transporting their own merchandise.

Long-distance trade over 1,000 km is provided by comparatively modern companies operating according to international agreements in trucking industry TIR and CMR. Significant long-haul transportation is found in Central Asia, mostly under the TIR provision connecting the region with Russia and Europe. Despite the distance, time-sensitive or expensive commodities have a more reliable supply chain by roads. Uzbekistan and Kazakhstan are the most important countries for transit by road serving also the needs of their neighbors.

Цифры автотранспорт?***

Prospects and opportunities for EATL road routes

Main market segments. It can be assumed that the role of road transport will grow in the most of the EATL countries following the demand for high quality and flexible logistic services. In particular, the following main spheres look reasonable:

- short-run cross border trade;
- long haul transportation on the lanes where railway links do not exist or can't provide effective services for certain commodities (perishable, expensive, etc.);
- "road section" of intermodal rail-road transport service. This section connecting the consignor (consignee) and intermodal terminal or logistic center can be hundreds or even thousands kilometers long.

The last option is the most important one from the point of view of logistic supply chains transport provision and improving the competitiveness of EATL links.

In the EU region combined transport development is the general line of the transport policies and many shippers make their choice in favor of combined transport instead of "straight trucking".

The main reason is lower costs but environmental factor is also more and more considered. Within the highly developed intermodal networks additional effects are available such as “synchrologistic” management of flows switched from one mode to another according to the market situation. The combined rail-road services, if developed across the Euro-Asian trade lanes, could link together the Asian and European transport systems not just technologically but also within the high-quality logistic service chains.

Certain examples of projects of this kind can be found on the market. Deutsche Post DHL has developed its new service in partnership with Chinese rail operator YHF Logistics. The once-a-week service runs through to its intermodal hub in Malaszewicze, Poland, and the company then trucks shipments to Moscow to offer a 20-day transit time between Chengdu and Moscow (figure 2.9). The common sense says there is no reason to ship freight through Russia to Poland before trucking it back to Moscow, but the company representatives say this option avoids potential problems with the rail network going into Moscow.

It turned out that the intermodal decision in fact cuts transit time and transport costs significantly by overcoming potential delays that can be encountered when entering Moscow by rail [<http://postandparcel.info/56547/news/innovation/dhl-launches-weekly-train-link-from-china-to-poland/>].

Figure 2.9. Deutsche Post DHL combined service

Road parameters. Long and heavy road vehicles. The harmonizing of road parameters and introduction of long and heavy vehicles (LHV), or road trains, seems to be one of the opportunities to increase the efficiency of road transportation in the EATL area.

The average standard gross weight of the freight road vehicle all around the world is about 40 tons which provides the payload of about 20 tons. The allowed length of the road combination rarely exceeds 20 meters. The full vehicle weight is limited by the bridges construction; the allowed axle load depends on the carrying capacity of the road. The vehicle length depends on road safety standards adopted in certain country.

It is very important to have the road limitations equal for all the sections of the long-haul road route. If this condition is not fulfilled, it is necessary either to pay fees for overloading on certain sections or even to partially unload the cargo and use another vehicle to pass through the leg with

more strict limitations. Unfortunately, in practice it happens not only in case of two neighbor countries with different road standards but also within one country with uneven road quality.

Besides the harmonizing the road limitations across the main corridors, it is worth mentioning the option of using heavy and long vehicles.

Many countries have the experience in allowing (on certain sections of the road network) the road vehicles with weight and length that exceed the generally accepted standards. The goal is to improve the efficiency of transportation on the most loaded trade lanes.

This trucking concept is used in remote areas of Australia, the United States, and Western Canada. A road train consists of a relatively conventional prime mover, but instead of pulling one trailer or semi-trailer, the road train pulls two or more of them.

Australia has the largest and heaviest road-legal vehicles in the world, with some configurations topping out at close to 200 tons of the gross vehicle weight. The majority are between 80 and 120 tons. The train length reaches 53 meters (see figure 2.10).

Axle loads of the road train do not exceed the limit because the number of axles supporting the LHV is higher according to its increased length. As for the high gross vehicle weight, it sometimes makes necessary to enforce or rebuild the bridges along the routes where the LHV are operated.

Driving and maneuvering the Australian road trains safely without unduly obstructing traffic is only possible because of the sparse traffic and extremely flat and straight terrain through the Australian outback. The same requirements are taken into account in all the countries where LHV are allowed. Strict regulations also apply regarding licensing and driving experience. The multiple trailers are unhooked, the dollies removed and then connected individually to multiple trucks at assembly points (often located at terminals or logistic centers) when the road train gets close to populated areas with dense traffic.

Many of the EATL countries, especially in the Central Asian region, have conditions the make operation of the LHV possible. But this concept is developed not only in the regions with low economic and transport density.

In Europe the so called European module system (EMS), or Eurokombi concept is widely discussed currently. The idea is to allow longer and heavier combinations within one road vehicle using the existing equipment. Figure 2.11 shows how three standard European combinations can be converted into two by just recoupling the equipment. The EMS road train has the 25,25 m maximal length and the gross weight of 60 or 44 tons for different combinations (for volume or for weight cargoes). The average economic effect in comparison with traditional combinations is about 20-25%.

The Eurokombi vehicles are used for many years in Sweden and Finland and are already tested in the Netherlands, Denmark and Germany with positive experience.

The supporters of the LHV idea argue that this type of vehicle:

- increases transport efficiency and economic competitiveness;
- dramatically reduces the number of vehicles for a given amount of goods;

- reduces environmental impact of trucking;
- reduces road congestion and road wear;
- supports intermodal transport.

There is no doubt that the EMS concept as well as the experience of LHV operation in other regions of the world is worth serious attention of the EATL countries. The best results can be achieved if the EATL countries work at recommendations to support a harmonized application of the LHV.

1.3.6. Air routes and main airports

As Boeing in its “World Air Cargo Forecast 2014-2015” reported³, the Europe-Asia⁴ market comprises approximately 19.6% of the world’s air cargo traffic in tonne-kilometers and 10.0% in tonnage.

Figure. **. Volume of Europe – Asia air cargo traffic in 1998-2013, millions tonnes

Source: World Air Cargo Forecast 2014–2015

Europe-Asia air cargo traffic has averaged 5.5% growth per year since 1998. The market contracted 3.1% in 2012 but then grew 1.4% in 2013. The Europe-Asia annual growth chart shows overall air traffic flows between Europe and Asia that also contain some sixth-freedom traffic that flows into or out of other regions. The chart does not represent the actual trade flows by direction. Therefore, comparisons should not be made between the chart and the following air trade flow analysis.

Figure. **. Annual growth of air cargo flows on the routes Asia – Europe and Europe – Asia in 1998-2013, %

Source: World Air Cargo Forecast 2014–2015

³ World Air Cargo Forecast 2014–2015. Boeing, Seattle, 2014

⁴ For the purposes of forecast, the Boeing defines Europe as all 27 member countries of the European Union plus Switzerland, Norway, Iceland, Turkey, Albania, Gibraltar, and all the countries of the former Yugoslavia. Asia is defined as Japan, China, Hong Kong, Taiwan, South Korea, Singapore, the Philippines, Indonesia, Malaysia, Thailand, Vietnam, Macau, Cambodia, New Zealand, and Australia.

During the early 1990s, Europe's imports showed no growth as the recession that followed the 1991 Gulf War took a heavy toll on the European economy. At the same time, Asia's demand for Europe's goods increased dramatically.

Since 1998, Asia-to-Europe flows have exceeded Europe-to-Asia flows. By 2008, Europe was importing 2.3 million tonnes from and exporting 1.6 million tonnes to Asia. The gap between Europe's imports and exports has reversed as a result of the global economic downturn of 2008 and 2009 and of attendant aggressive financial stimulus in Asia. China led the way with a stimulus package equivalent to 3.2% of its GDP in 2009, exceeding the 2% GDP stimulus recommended by the International Monetary Fund. The European economy continued to struggle from 2011 through 2013, leading European imports to contract. In 2012, the gap between Europe's imports and exports was approximately 2,800 tonnes, In 2013 Europe's exports surpassed imports by approximately 62,000 tonnes.

The overall Europe-Asia market grew 1.4% in 2013 after contracting 3.1% in 2012. The Europe-to-Asia flow grew 3.0% in 2013 after declining 2.4% in 2012. In the Asia-to-Europe direction, the flow declined 0.1% in 2013 and 3.7% in 2012. The contraction in Europe's imports reflects the state of the European economy, which grew at a lackluster pace of 0.4% in 2013 and contracted 0.1% in 2012.

Long-term air cargo growth has maintained a steady 5.5% average annual rate since 1998 despite these temporary reversals. The air cargo market in the Europe-to-Asia direction has grown 6.5% per year over the same 15-year period. In the Asia-to-Europe direction, the market averaged 4.6% growth.

The Asia-to-Europe flow consists primarily of consumer goods, while the Europe-to-Asia flow is primarily manufactured goods.

Figure. **. Air cargo structure by main commodity groups on the routes Asia – Europe and Europe – Asia in 2013, %

Source: World Air Cargo Forecast 2014–2015

In the Europe-to-Asia direction, the top six commodity categories account for 60% of air cargo traffic. In descending order, the categories are general industrial machinery, food, computers, electrical machinery and apparatus, documents and small packages, automobile parts and accessories, and articles of apparel. In the Asia-to-Europe direction, the top four commodity categories account for 77% of air trade. The categories are:

- computers,

- electrical machinery,
- and apparatus;
- documents and small packages;
- articles of apparel; and
- general industrial machinery.

One particularly fast-growing market segment between Europe and Asia has been documents and small packages, sometimes referred to as “traditional express traffic.” This trade flow has averaged 5.9% annual growth in daily shipment count in both directions since 1998, as the movement of business samples, legal documents, and other expedited small-batch items between Europe and Asia has increased. The total bidirectional express market averaged nearly 375,000 shipments per day in mid-2013.

Europe-Asia air cargo market forecast

Base, low, and high models were developed to forecast the Europe-Asia air cargo market. GDP projections of 0.5% below and above the baseline were assessed, and the results of these growth rates are reflected in the low- and high-growth scenarios.

Figure. **. Europe-Asia air cargo market forecast till 2033 by Boeing, millions tonnes

Source: World Air Cargo Forecast 2014–2015

Europe-to-Asia flows will average 5.2% growth as China continues to open its markets in accordance with WTO guidelines. Several hundred million people in Asia will become moderately affluent and are expected eventually to demand increasing quantities of goods from Europe.

Asia-to-Europe flows will grow slightly faster, with long-term growth averaging 5.3% during the forecast period.

Figure. **. Asia-Europe air cargo market forecast till 2033 by Boeing, millions tonnes

I.4. EATL related sea ports and their hinterland connections

I.4.1. Sea ports role in EATL corridors

Maritime shipping is the main mode of transport in international trade and seaports remain the crucial nodes of international transport and trade. They act not only as the hubs of global shipping network but also as biggest portals and distribution centers of the continental logistic systems.

The role of seaports in supply chains is evolving with the progress of supply chains themselves. This evolution is most evident in the transport system of the European Union where sea ports are deeply integrated in the whole logistic infrastructure.

Port organization and functions in Europe has gone through several stages. According to [14] the following main stages can be highlighted.

Stage one. Since 1970-s on the wave of containerization enormous efforts were undertaken by different stakeholders involved in port business together with the port authorities to optimize internal port processes and make ports more efficient.

Stage two. Since the 1990s cooperative interaction between ports has rapidly gained importance. The main driving forces were the emergence of short sea shipping, increasing vessel sizes and volumes and consequently the growing pressure on port capacity. During this phase different types of ports have emerged each playing special role within the sea-land interface:

- main ports: attract large volumes in all market segments and serve ocean-going vessels;
- transshipment ports: handle large container flows, although their distribution function towards the hinterland is rather limited. The main function of transshipment ports is to interconnect ocean container lines and feeder routes;
- second-tier ports: these have an important cargo-bundling and distribution function. The transshipment function can still be important, but lower volumes are generated than at main and transshipment ports;
- third-tier ports: these are largely focused on the “immediate” hinterland (closely located customers). Often not all market segments are served by these ports.

Stage three. Since the first decade of the century, a ‘terminalization phase’ is going on. Port business is increasingly focused on specialized terminals through which the hinterland is served. Ports are no longer considered to be purely transfer centers, but are becoming comprehensive flow-through areas within logistics chains, which are functionally linked to distribution developments in the hinterland.

Inland logistic centers and terminals are becoming important consolidation hubs for seaports. They act not only as cargo-bundling points, reducing capacity pressure on seaport terminals, but also as distribution centers. Seaports and inland terminals belong to the intermodal transport system serving the European supply chains.

Stage four. While port terminalization is still unfolding, the next phase in the rapidly changing logistics market is already starting to emerge, i.e. the formation of genuine port networks. [14].

In such an environment the sea ports, although competing, are more and more in constant cooperation within supply chains and the cargo flows are flexibly distributed between them following the market situation.

Sea ports are of great importance for EATL countries. They do not just provide overseas trade for maritime and landlocked countries and effective transshipment between marine transport and other modes. Trade and transport flows passing through the sea ports and the port access infrastructure benefit from the economies of scale that makes inland transportation in hinterland areas (which can extend for thousands of kilometers) cost-effective.

Besides that, the logistic infrastructure of ports themselves as well as that of the dry ports, that can be located hundreds of kilometers in the hinterland, provides enormous added value in supply chains.

According to the contemporary logistic approach, sea ports should not be analyzed or developed as isolated units. Development plans should consider also the port hinterland connections and the infrastructural objects located in the hinterland and directly linked to sea ports (logistic centers, dry ports, inland intermodal terminals). Such an approach should be used while developing national transport policies and infrastructure development plans, as well as in the regional documents adopted by EATL countries.

Developing economies' share of world container port throughput in 2014 increased marginally to approximately 71.9 per cent. This continues the trend of a gradual rise in developing countries' share of world container throughput [Maritime review 2014].

With the strong economic growth of Asia, namely of China, cargo throughput in Asian seaports has steadily grown in the past 10 years. The major European ports Rotterdam, Antwerp, and Hamburg, have only grown by 167 per cent, 159 per cent and 144 per cent respectively in the same period of time. In 2014, the ports of Ningbo-Zhoushan, Shanghai, Singapore, Tianjin have become the biggest seaports by tonnage in TEU, and world's biggest container ports.

The EATL route network is connected to many of these major seaports. The 20 important seaports are located in the Baltic and North Sea, in the Mediterranean, on the Pacific coast, and on the Gulf in the Arabian Sea (See Figure 2.12* and Table 2.3). **Нужно определиться с важнейшими портами**

The biggest seaport on the Baltic Sea is Riga (Latvia) with an annual cargo throughput of 34,040,000 tonnes (2013). In the Mediterranean the biggest port by throughput is Piraeus (Greece) with 40,192,000 tonnes (2013), while on the Pacific coast Shanghai is the biggest port with an annual throughput of 543,000,000 tonnes (2013).

Other important ports that are not direct end points of EATL routes but are in close proximity are the major European ports in the North Sea, such as the port of Rotterdam (Netherlands)- (annual throughput of 406,549,000 tonnes (2013), as well as the ports of Bandar Abbas (Iran) and Karachi (Pakistan)-41,350,000 tonnes (2013-2014) in the Arabian Sea

In addition to maritime seaports the EATL network encompasses also major ports in the Caspian Sea, where the ports of Baku (Azerbaijan) and Aktau (Kazakhstan) had an annual cargo throughput of 25,000,000 tonnes and 12,000,000 tonnes respectively (2011), and in the Black Sea, with the port of Ilyichevsk (Ukraine) and the port of Varna (Bulgaria) with annual cargo throughput of 15,530,000 tonnes and 12,950,000 tonnes respectively.

The seaports on the Pacific side, Shanghai (China), Lianyungan (China), Vladivostok (Russia) and Nakhodka/Vostochny (Russia) play an important role for the EATL as they connect Eurasia with the Republic of Korea, Japan and Taiwan Province of China. Car manufacturers such as Daewoo Motors, Kia Motors and Hyundai have been using these ports as entry gates to the Russian and Chinese markets, and use the Trans-Siberian Railways for container freight trains of automotive parts and cars from and to their production sites inside Russia and Uzbekistan.

The Baltic Sea ports of Ventsplis, Riga and Klapeida actively position themselves as regional hubs in the East-West transport link between Europe and Russia²⁴ and the North—South transport link to the Black Sea and the Caucasus. Many container freight services connecting these ports are a witness of this positioning. The Iranian ports of Bandar Abbas and Chabahar are also looking towards building a landbridge to Afghanistan, Central Asia and China through Central Asia with the Iran Railways currently building a railway connection from Sangan, in the South East of the country close to both ports, to Herat in Afghanistan.

Table 2.3.EATL system seaports and their relation to EATL routes

I.4.2. Ports statistics and trends

To be completed

Draft for information only

1.4.3. Most important sea ports identification

Identifying the major sea ports in the EATL transport system needs some criteria to choose among 43* sea ports related to EATL routes. Authors of the report developed the list of characteristics used the following criteria for that, considering that the major sea ports should have the following features:

- belong to EATL railway corridors (the more corridors the port is related to the higher is the importance of the port);
- have a relatively high throughput;
- demonstrate good progress in throughput during 5 recent years and/or
- provide direct ocean access on the foreland side.

1.4.4. Logistic centers and dry ports and in the EATL system

Smooth functioning of the supply chain requires modern infrastructure. Nowadays logistic centers are considered to be the mandatory components of logistic infrastructure carrying on numerous functions in the supply chains.

Europlatforms [20] give the following description of logistic center (LC) concept: “It is a designated area within which all operations connected with transport, logistics and distribution of goods are performed by different operators as part of deliveries, both on the national and international level. These operators may be owners of built and situated in the center: buildings, offices, warehouses, storage yards, parking places, facilities, etc. or use them pursuant to leasing or rental agreements. In order to respect the principles of free competition, the center must ensure access to all companies involved in activities described above. The logistics center must be equipped with devices and facilities available to the general public allowing to provide services. Whenever possible it should also ensure public services for the staff and users’ equipment. In order to support the development of inter-modal technologies in cargo relocation, the logistics center should be supported by many branches of transport. It is also necessary that the center be run by an entity appointed especially for this purpose from the public or private sphere”.

Logistics centers have the most extensive structure of all components comprising the logistics network. They are composed of many facilities collaborating with each other and co-operating logistics operators. LC enables to conduct operations on goods in connection with warehousing and relocating them between the shipper and the consignee, providing intermodal transportation and value-added services against the transported commodities.

Intermodal terminal is the specific component of the logistic center. It serves not only as a pivot where cargo (usually in containers, contrailers or swap-bodies) is transshipped between the modes. Logistic centers’ intermodal terminals are the origin/destination points for regularly operating block-trains linking the LC with other LCs located in sea ports, surface transport nodes, logistic hubs, industrial areas, etc. This is the most attractive feature for logistic operators locating their business on the LC.

The LC idea is currently used in most of the developed economies. Various terms, besides the *Logistic Center*, are used to identify the objects of the type in different countries: *Terminal village*, *Freight village*, *Logistic Village*, *Dry Port* – in English-speaking countries, *GuterVerkehr Centrum* (Center for Freight Transport) – in Germany and Austria, *Interporto* (transshipment point) – in Italy, *Rail Service center* – in Netherlands, *Platform de Fret*, *Platform Logistique* (Freight platform, logistic platform) – in France.

While in Europe and in North America logistic centers have long ago become the compulsory component of logistic infrastructure, Asia is just in the early stage of LC development. To speed it up, in 2013 the Intergovernmental Agreement on Dry Ports was concluded under the auspices of the United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP). The Agreement is aimed to promote the cooperation of the development of dry ports in the Asia-Pacific region. As of April 2016, the Agreement has been signed by 17 UNESCAP states.

The Agreement identifies a number of existing and potential dry port locations that are to be the basis of a coordinated effort to create nodes along an international integrated intermodal transport and logistics system.

According to the Agreement, a dry port of international importance (“dry port”) refers to an “Inland location as a logistics center connected to one or more modes of transport for the handling, storage and regulatory inspection of goods moving in international trade and the execution of applicable customs control and formalities”.

The Agreement (in its Annex I) identifies the dry ports subject to the agreement. The locations of the dry ports listed in the Agreement were chosen considering the following factors:

- a) inland capitals, provincial/state capitals;
- b) existing and potential industrial and agriculture centres;
- c) major intersection of railways (Trans-Asian Railways), highways (Asian Highways) and inland waterways;
- d) along trunk railways lines (Trans-Asian Railways), major highways (Asian Highways), inland waterways and airports/

The basic functions of dry ports include the handling, storage and regulatory inspection of goods moving in international trade and the execution of applicable customs control and formalities. Additional functions of dry ports may include, but are not limited to receipt and dispatch, consolidation and distribution, warehousing and transshipment.

The dry ports listed in the Agreement should be brought into conformity with the guiding principles for the development and operation of dry ports as described by Annex II of the Agreement. The guiding principles consider dry port functions, institutional, administrative and regulatory framework, design, layout and capacity of dry ports, their equipment and facilities.

According to the Agreement, the Parties adopt the list of dry ports as the basis for the coordinated development of important nodes in an international integrated intermodal transport and logistics system. They also intend to develop these dry ports within the framework of their national programmes and in accordance with national laws and regulations.

The implementation of the Agreement is considered by a Working Group on Dry Ports created according to the Agreement.

It appears that logistic centers in the EATL system should be the relay between transport corridors and regions. They should become international trading centers, interfaces between modes and between agencies participating in transportation and logistic process.

Being created in the hubs of EATL network, logistic centers could become the logistic “pivots” carrying on the following functions:

- acting as the points of local integration/distribution of goods in particular areas;
- serve as effective warehousing zones directly connected to transport services;
- being points of smooth transshipment between rail and road (as well as between different railway links) within intermodal transport services;
- act as platforms for industrial zones linked transport-logistic network;
- provide the possibility for value-added services execution within the supply chains;

- being located nearby the borders – provide infrastructure for effective border check procedures;
- being located on the connection points of different rail gauges – give opportunity to combine boogies exchange or freight transshipment with intermediate warehousing and/or value-added services.

In other words, Logistic Centers developed within the EATL network could become the modern market-oriented nodes of supply chains improving the competitiveness of the entire EATL system.

To be effectively inter-connected dry ports and inland terminal should provide standard – by scope and quality – logistic services. Currently these parameters differ much across the EATL terminal objects.

It seems reasonable to analyze the possibility of developing “Terminal services standard minimum” – first, in a form of recommendations or “Best practices manual”. Primarily this task should be done concerning container business.

Figure *illustrates the location of dry ports (envisaged by the 2013 Intergovernmental Agreement on Dry Ports) related to EATL railway routes.

Figure **. Dry ports listed in the 2013 Intergovernmental Agreement on Dry Ports related to EATL corridors

Comparative analysis of the duration and expenses of different modes of transport between Europe and Asia on selected Euro-Asian routes

General

On May 1998 in St. Petersburg, Russian Federation, during the International Euro-Asian Conference on Transport, European and Asian countries declared the desire to further connect and integrate their transport systems. One of the central ideas of such integration was to benefit from development of overland routes that are obviously shorter than the maritime lines.

At the same time, pure distance itself can not be the practical criteria of the route choice. Total transportation time (including the delays on the way), full delivery costs, service frequency and reliability, cargo “time sensitivity”, value added services *en route* and other factors are considered while making such a decision.

For this reason, comparative analysis of maritime and overland routes connecting Europe and Asia is undertaken constantly in numerous studies held by different agencies and researchers. The aims of such an analysis can differ. In particular, they are undertaken in order to:

- demonstrate the principle advantages of particular overland corridors;
- choose the most competitive overland route among several options;
- evaluate the volumes of cargo that can be attracted to the overland routes, and so on.

This section contains several examples of the sea and overland routes comparative analysis:

- the upgraded fragment of the analysis undertaken during Phase II of the EATL research;
- the study undertaken by the Russian Centre for Economic and Financial Research at the New Economic School (CEFIR);
- the research provided by PLASKE – freight forwarding company involved into the Euro-Asian intermodal container transportation;
- the Eurasian Development Bank study.

Phase II research

The Phase II study contained the section dedicated to comparative analysis of the maritime and inland Eurasian routes based on the time-cost methodology. The analysis included the total time and costs within the entire supply chain, which include road transport costs of moving containers from/to the warehouse/port, terminal handling charges, and documentation and other administrative costs. The structure of time and cost for compared routes is illustrated by figure *.

Figure *. Structure of time/costs considered by the EATL Phase II study

Nine scenarios were analyzed. In all scenarios, rail transport performed better than maritime in terms of travel time. The Study showed that Euro-Asian rail transport, and its intermodal combination with maritime and road transport, is a feasible and competitive transport option provided that efficient rail corridor management is established, governments are willing to cooperate and rail companies serve customers' needs in an effective manner along the whole corridor.

In this section the selected results of this analysis are presented (6 scenarios out of 9, see table *). These results often can not give the definite advantage to certain option because time and costs comparison results can be contradictory (see the "Total Result" column of table * where ++ means both the time and cost advantage of overland route and 0 means that the comparison result is undefined).

Table *. Selected results of the comparative analysis of the maritime and inland Eurasian routes (EATL Phase II study)

	Trade lane	Maritime		Overland		Result		
		Time	Cost	Time	Cost	Time	Cost	Total
	Khabarovsk - Potsdam	1093	6533	341	6967	+	-	0
	Hangzhou - Kaluga	637	6786	277	4715	+	+	++
	Tashkent - Varna	529	7550	165	5946	+	+	++
	Almaty - Istanbul	672	4970	250	5881	+	-	0
	Ussuriysk (Russian Federation) to Kyiv (Ukraine)	463	6290	289	5875	+	+	++
	Shanghai -	569	6300	446	8937	+	-	0

	Warsaw							
--	---------------	--	--	--	--	--	--	--

This comparison was continued and “upgraded” on the base of value of time data used in the World Container Model (see section **). Since the value of time can dramatically differ for different commodities, three options were used for calculations – low, average and high value (see table *).

Table *. Value of time options

	Commodities	Value of time, Euro/day/ton
Low	Solidmineralfuels	1
Average	Foodstuffsandanimalfodder	5
High	Machinery, transport equipment, manufactured and miscellaneous articles	8

For calculations it was assumed that the average payload of the FEU is 15 tons. The values given in table * were converted into US dollars. After that the “Total costs difference” including all the charges *en route* plus the “time costs” were calculated for all the routes compared. The results are shown in table *.The negative quantity of the total cost difference means that the overland transportation option is preferable.

Table *.Comparison of routes taking into account the value of time

	Trade lane	Total cost difference		
		Low	Average	High
	Khabarovsk - Potsdam	-92,40	-2221,50	-3814,80
	Hangzhou - Kaluga	-2323,00	-3342,25	-4105,00
	Tashkent - Varna	-1858,80	-2889,38	-3660,60
	Almaty - Istanbul	615,60	-579,19	-1473,30
	Ussuriysk (Russian Federation) to Kyiv (Ukraine)	-536,80	-1029,44	-1398,10
	Shanghai - Warsaw	2550,90	2202,66	1942,05

The results confirm the general conclusion made during Phase II of the project that at certain conditions many commodities can be effectively transported using the rail EATL routes. Among

the analyzed trade lanes the sea option is more effective only the Shanghai – Warsaw direction (for all types of commodities considered) for obvious reason – shortest land leg of the route.

The CEFIR study

The study [16] described in this section was undertaken by the Russian Centre for Economic and Financial Research at the New Economic School (CEFIR) in order to evaluate the transit potential of the Russian Federation in respect to goods flows between Asia and the European Union. The study compiles the information available from the RETRACK project (FP6 EC program) and work done on the development of the World Container Model (WCM). The main goal of the study is to evaluate the Euro-Asian cargo volumes that can be transported via the following routes:

- **TransSib (TSR)** (red line on figure *). This rail link begins in North Eastern China, going North directly into Russia. The Russian TSR ends in Moscow, from which the line continues further via Belarus to central Poland;
- **TransSib – Kazakh**, light blue line. This rail link starts in Western China, going via Kazakhstan in the North-Western direction. It joins the TSR line in Russia and follows the Trans-Siberian corridor further;
- **Central corridor**, brown line. This rail link starts in Western China, going via Kazakhstan in the Western direction and enters Russia in the South, then continues via Ukraine and finally ending in Slovakia;
- **Maritime (Suez) route**, dark blue line. The maritime link starts in the Eastern coastal China, uses Suez Canal to get into the Mediterranean Sea. For the West Europe, the link can be extended further through the Strait of Gibraltar.
- **Arctic route**, green line The potential of this route was a special point of the study; it is not described in this report.

Figure*.Transport routes considered by the CEFIR study

The potential assessment is made using the concept of the total logistics costs. The costs of transport between origin and destination points consist of two main components.

The first component contains the costs attributed to physical transport. These include the costs of moving loading units (containers, bulk units) between loading and discharge points and costs of transshipment (deep sea terminal costs, rail terminal costs, etc.). These are the so-called “out of pocket” costs that the cargo owners have to pay to move their goods.

The second cost component of the total logistics costs is related to the time that the goods spend in transit. The goods in transit freeze capital, causing the so-called pipeline stock keeping costs. However, the cost for capital frozen in transported goods is often not the greatest time-related cost component. While the goods are in transit, the market situation can change. Demand variability leads to capital expenditure on safety stocks that cover the uncertainty in demand during the period of transportation. Transit time also reduces company ability to react to other market events, such as introduction of new products by the competitors. In the case of new product introduction, the goods arriving later lose a substantial part of their value and are sold at a discount. The time-related component of the total logistics costs can be summed up in the Value of Time (VOT) value, which is commodity-specific.

The relevant estimations of time value for different goods are used in the World Container Model (WCM)⁵. The model has been calibrated to reflect worldwide goods flows: the VOT values used in the model have thus been proven to be realistic estimates.

For the assessment of the maritime and rail land bridge potential the total logistics costs for three rail corridors and the deep sea route indicated above were computed. The assessment of the corridors is based on their economic attractiveness: the corridors with smaller total logistics costs will be more attractive for the cargo owners.

For the objectives of the calculation, China had been split into 4 distinct regions, each having different growth prospects, economy properties, available infrastructure and various access costs to the Eastern deep sea ports: Western China (CN1), Central China (CN2), Coastal China North (CN3), Coastal China Center / South (CN4).

The model performs computations for the 4 Chinese regions, linking the regions to each of the 27 EU countries. All trade and transport volumes go to / come from the “centers” of those 4 regions.

Table *.Regionalization of trade between EU and China within Chinese regions

ChineseRegion	Shareofimport / export
WesternChina	0,05
CentralChina	0,05
CoastalChinaNorth (CN3)	0,45

⁵A strategic network choice model for global container flows: specification, estimation and application, LórántTavasszy, MichielMinderhoud, Jean-François Perrin, Theo Notteboom, Journal of Transport Geography, Volume 19, Issue 6, November 2011, Pages 1163–1172

Coastal China Center / South (CN4)	0,45
------------------------------------	------

The model estimated the average distances to and from each of the 27 EU countries to the European end points of the corridor. The same was also done for China: the distances were estimated between the 4 considered Chinese regions and the starting points of the corridors. These distances were used to determine the total logistics costs of transport to and from the rail corridors

The scenario 2020 used estimations over the expected at the time trade growth between China and the EU-27, expected improvements in rail infrastructure and spatial changes in the Chinese economy for the decade.

The Value of time in the model was expressed in euro/day/tonneper NSTR (*Nomenclature uniforme des marchandises pour les Statistiques de Transport, Révisée*) commodity typecomputed for the World Container Model (WCM). Commodity groups and corresponding Value of Time considered are presented in table *.

Table *.NSTR/1 commodity classification and value of time for commodity groups

NSTR/1 code	Commoditytype	Value of time (Euro/day/ton)
NSTR0	Agricultural products and live animals	3,8
NSTR1	Foodstuffsandanimalfodder	5,0
NSTR2	Solidmineralfuels	1,0
NSTR3	Petroleumproducts	3,4
NSTR4	Oresandmetalwaste	2,6
NSTR5	Metalproducts	7,0
NSTR6	Crude and manufactured minerals, building materials	1,0
NSTR7	Fertilizers	1,0
NSTR8	Chemicals	7,0
NSTR9	Machinery, transport equipment, manufactured and miscellaneous articles	8,0

Main model parameters are presented in table *.

For the basic model (year 2010) transit time was calculated after the interviews with the stakeholders and expert opinion (RETRACK project⁶). Transshipment and shadow costs (reflecting a “resistance” for the goods flow, in particular, the non-physical barriers) were based on expert opinions and model calibration runs.

As for 2020, the assumption was made that the transit time between Europe and China across the rail corridors will improve. In addition, the ton-kilometer tariff and shadow costs are also expected to be reduced. These assumptions were all based on the proposed investments into the railways systems improvement between 2010 and 2020. The shadow costs for the rail corridors were estimated to be lower than in 2010, reflecting expected improvements in infrastructure and service. The maritime shadow costs have been kept constant.

Table *. Main model parameters for 2010 and 2020

Corridor	Distance, km	Transit Time, days		Transport Cost, Euro/tonne/ km		Transshipment and shadow costs, Euro/tonne	
		2010	2020	2010	2020	2010	2020
TSR	8,000	20	14	0,07	0,035	400	300
TransSib – TransKazakhstan	5,200	16	12	0,07	0,035	500	400
Central	5,500	18	12	0,07	0,035	800	400
Maritime(Suez)	16,000	30	30	0,0025	0,0025	100	100

Table * shows the model cargo distribution between the corridors.

Table *Estimated 2010 and 2020 rail corridor and maritime volumes between China and EU 27

Volumes distribution, China – EU27, % to total	2010	2020
	TSR corridor	1,4
TransSib - Kazakhcorridor	0,2	6,0
Centralcorridor	0,3	4,4
Maritime (Suez) corridor	98,1	81,5
Total	100	100

⁶Retrack – Reorganization of Transport Networks by advanced Rail freight concepts: <http://www.retrack.eu/>

One of the interesting aspects of the modelling was the study of competition between the overland corridors influence. In the basic 2010 scenario the low volumes imply that inter-corridor competition does not have an impact, as the corridors “do not see” each other. The growth, if any, is a result of attracting cargo from marine route. Contrary to the 2010 estimated situation, in 2020 competition would have an effect on rail volumes. The authors of the study conclude that weaker corridors would be more strongly affected by the intra-rail competition than the more attractive ones.

According to the modelling results, in 2010 the TSR and Kazakhstan corridors were the most attractive options, with the Kazakhstan corridor being slightly more attractive than TSR. Central corridor is not a viable option according to the modelling results.

In 2020, the TSR will become the most attractive rail land bridge, while the Kazakhstan land bridge will slightly lose its attractiveness. The most important expectation for 2020 is that the Central corridor will also become a good transport option, not being far behind the leading corridors.

The increased competitiveness of the TSR corridor in 2020 can be explained by the fact that this corridor has the fewest number of border crossings and transshipments (and the shadow costs are the lowest). Even assuming favorable developments in respect to infrastructure and alleviation of institutional barriers, border crossings and transshipment will still add extra transit time and costs. The extra times and border crossings are a strong structural resistance factor.

Generally, the modelling demonstrated that the total share of overland Eurasian transport can be increased from 1,9 to 18,5%. But to obtain this result, dramatic changes should occur: transit time must decrease by 25-30%, transport costs should be at the 50% level to the 2010 basis, transshipment and shadow costs should decrease significantly as well. It is clear now that this optimistic scenario is not realized in practice.

PLASKE company study

The research described below was provided by the PLASKE company – freight forwarder with experience in Euro-Asian intermodal container transportation [13].

The target of the research was the comparison of time and cost for cargo transportation via three rail EATL routes (No. 1, no. 2 and no. 7) and the sea route from China. The origin points are located nearby the sea (Shanghai), and in the remote from the sea region (Beijing). Destination point is Warsaw (Poland).

The 40'box containing motors for household sewing machines (cargo that requires no additional control measures), net weight 20 tons, was chosen as the object of transportation.

The specified delivery time is the smallest possible on the market.

Seven routes were chosen for the analysis: two of them connecting Shanghai and Warsaw and four between Beijing and Warsaw:

1a) **Shanghai**-Shanghai sea port – containership by sea - port of Gdańsk – railway container train - **Warsaw**;

1b) **Shanghai**- Railway route EATL No. 7 (China-[BCP Alashankou/Dostyk]-Kazakhstan-[BCP Saryagash/Keles]-Uzbekistan-[BCP Beyneu (Karakalpakia) /Oasis]- Kazakhstan -[BCP

Aksaraiskaya/Ganyushkino]-Russia-[BCP Gukovo/Krasnaya Mogila] - Ukraine-[BCP Mostiska/Pshemyshl]-Poland), **Warsaw**;

2a) **Beijing**-railway container train -port Shanghai- containership by sea-port of Gdańsk- railway container train - **Warsaw**;

2b) **Beijing** - railway route EATL No. 7 (China-[BCP Alashankou/Dostyk]-Kazakhstan-[BCPSaryagash/Keles]-Uzbekistan-[BCP Beyneu (Karakalpaka) / Oasis]- Kazakhstan-[BCP Aksaraiskaya / Ganyushkino]-Russia-[BCP Gukovo/Krasnaya Mogila] – Ukraine - [BCP Mostiska/Pshemyshl] -Poland), **Warsaw**;

3a) **Beijing**-railway container train -port Shanghai-containership by sea -port of Gdańsk-railway container train -**Warsaw** (coincides with route 2 (a));

3b) **Beijing**-railwaycontainer train route No. 1 EATL (China-[BCPMančžouli/Zabaykalsk]-Russia (Trans-Siberian railway)-[BCP Red/Osinovka]-Belarus-[BCP Brest/Terespol]-Poland), **Warsaw**;

4a) **Beijing**-railwaycontainer train -port Shanghai-containership by sea -port of Gdańsk-railway container train -**Warsaw** (coincides with route 2 (a));

4b) **Beijing**-railway route EATL No. 2 (China-[BCPAlashankou/Dostyk]-Kazakhstan-[BCP Petropavlovsk (Mamlyutka)/Kokchetav]-Russia-[Red/Osinovka]-Belarus-[BCP Brest/Terespol]-Poland), **Warsaw**.

The results of the routes' comparison are presented below.

Case 1. Comparison of routes 1a and 1b (tables ***, figures**) shows that rail traffic between China and Poland through Central Asia will be competitive for the carriage of containers in container trains only (average speed of 1000 km/day). The difference in delivery times in favor of railways in this case is big enough: 28 days.

Under normal conditions (standard train) this time advantage will likely be lost due to downtime of a train on the border crossings.

At the same time, cost difference here is the largest of all of the scenarios in the study: overland route is more expensive than sea by 8 \$ 444.5. United States. The railroad crosses the territory of 7 countries (Kazakhstan, twice), and the total length of the path is 11 653 km-more than from China to Germany.

Table *. Route 1a components

TIME, HOURS

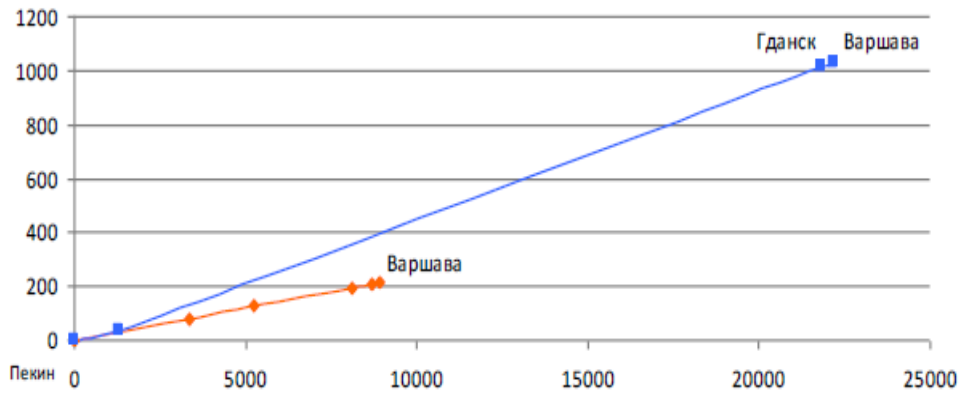

Figure * COSTS, USD diagram for routes 4a and 4b

Figure **. Cost - distance diagram for routes 4a and 4b

The difference in the cost of shipping container for these two routes is \$ 2953. The above chart clearly reflects the impact of generally higher costs for rail transportation. The railroad crosses the territory of 5 countries, and the total length of the path is 8 922 km, which is even smaller than along the route of the Trans-Siberian railway, but due to the territory of Belarus crossing the price for rail transportation increases significantly. The difference in delivery times compared to maritime transport is 33 days.

It should be noted that all the data relating to the cost of transportation on selected routes is picked from the public open sources: open publication of official statistics of the EATL countries and international organizations); analytical, statistical and empirical publications in specialized media; web sites of state and private companies as well as web resources created for the exchange of trade information.

At the same time, in each particular case price of transportation can and should be the subject of negotiation between shippers, carriers and other interested parties. Typically, this leads to the establishment of an acceptable price for these parties, which can differ significantly from the average, indicative figures obtained in this and other studies.

Eurasian Development Bank study

The Eurasian Development Bank published in 2016 the research note containing some preliminary estimates in regard to the potential transportation capacity and investment needs of various Silk Road Economic Belt (SREB) transportation routes that run across the Eurasian Economic Union's countries.

The study argues that currently the huge potential presented by land routes from China through Central Asia to Europe is not being utilized. According to the study, out of all land routes, only two are now in actual operation:

- Urumqi (XUAR) – Kazakhstan – Omsk – Moscow – EU (as regards transit, its estimated utilization ratio at 20%); and
- Shanghai – Trans-Siberian Railroad – Brest (Trans-Siberian Railroad utilization ratio currently reaches 100%).

The land route is considerably more expensive than the marine route. The study estimates the cost of marine transportation along the Shanghai – Rotterdam route as 10 cents per ton per mile, while the cost of railroad transportation is as high as 30 cents per ton per mile. Therefore, meaningful trading volumes can be generated only when dealing with China's western provinces.

The list of goods that can be profitably carried by land from central and eastern provinces is very limited and contains:

- export goods originating from China's western provinces (mostly the Xinjiang Uyghur Autonomous Region, the Tibet Autonomous Region, and the Qinghai Province). The alternative for those provinces is to take the goods to the shore (about 3,000 km), and then carry them by sea;
- limited selection of goods originating from China's central and eastern provinces. These are high unit added value products (electronic devices, automotive parts, pharmaceuticals, standard

and costume jewelry, etc.) and goods with critical delivery times (some food products, premium textiles).

The study points out at 6 potential transit corridors that can be used to deliver cargoes along the China – Europe route. These corridors are analyzed regarding their current condition and potential that can be reached after upgrading.

Route 1: Urumqi (XUAR) – Kazakhstan – Omsk – Moscow – EU. The cost of cargo delivery via this route strongly depends on the mode of transportation: it amounts to about US\$ 1,300 per 1 TEU for railroad carriage. Design capacity of this route is the highest among all SREB routes at 300,000 TEUs. Its utilization ratio currently does not exceed 20% of maximum capacity. The most established version of the Urumqi – EU route is the transport corridor passing through the following cities: Lianyungang, Zhengzhou, Lanzhou, Urumqi, Khorgos, Almaty, Kyzylorda, Aktobe, Orenburg, Kazan, Nizhny Novgorod, Moscow, and Saint-Petersburg with access to Baltic Sea ports. The bulk of transit cargoes use this route and the Trans-Siberian Railroad. One of its key advantages is that there is only one customs border between China and Kazakhstan. The route's most critical problem is its limited throughput capacity. To make it competitive, it needs to be overhauled, and its transport and logistical infrastructure needs to be expanded.

The volume of funding required to modernize and improve railroads in Russia and Kazakhstan, to develop the Urumqi – Omsk – Moscow – EU route, and to build six major logistical centers (including those already in operation) is estimated at US\$ 6 billion. Modernization will make it possible not only to boost cargo turnover, but also to bring railroad transportation tariffs down from US\$ 1,300 per 1 TEU to US\$ 1,000 per 1 TEU.

Route 2: Shanghai – Trans-Siberian Railroad – Brest; cargoes are delivered from China through Russia's Far East Maritime Province (PrimorskyKrai). The cost of cargo delivery from Vladivostok to Moscow using the Trans-Siberian Railroad currently stands at about US\$ 1,100 per 1 TEU, and US\$ 1,400 per 2 TEUs. The cost of railroad cargo delivery from Shanghai to Brest (including freight costs) will be about US\$ 2,200 per 1 TEU, and US\$ 3,000 per 2 TEUs. The overall throughput capacity of the routes is 250,000 TEUs, and it is already being fully utilized. The key problem of the route is that it has to use the busiest section of the Trans-Siberian Railroad: Omsk – Novosibirsk. This route is also longer than the Kazakhstan route. It will require construction of a number of new railroads, in some cases in mountainous areas. Subject to all those factors, this route will hardly prove to be attractive to China.

Estimates of required investments into modernization of the Trans-Siberian Railroad vary. The cost of construction of new additional sorting stations with adjacent container logistical terminals is estimated at US\$ 2 billion. Efficient utilization and modernization of existing private terminals and Russian Railways terminals and construction of several new logistical centers may reduce that cost to US\$ 1.2-1.4 billion. This will make it possible not only to increase the cargo turnover, but also to reduce transportation tariffs to less than US\$ 1,100 per 1 TEU for the Trans-Siberian Railroad, and to about US\$ 1,000 per 1 TEU for the Urumqi – Omsk – Brest route.

Route 3: Urumqi – Aktau – Makhachkala – Novorossiysk – Constanta. The cost of transportation (including transshipment to container carriers) currently stands at about US\$ 4,000 per 1 TEU for deliveries to EU, and US\$ 3,200 per 1 TEU for deliveries to the south of Russia. In theory, this route can be used to transport about 100 thousand TEUs per year (subject to existing port capacity and available fleet).

Route 4: Urumqi – Aktau – Makhachkala – Tbilisi – Constanta. The cost of cargo deliveries from China to Georgia will amount to US\$ 3,700 per 1 TEU. The route's current theoretical

throughput capacity does not exceed 50 thousand TEUs per year (subject to existing port capacity and available fleet).

The first issue arising in connection with further development of trans-Caspian routes is that none of the existing Caspian ports is ready to process massive cargo flows. All port facilities require serious modernization. To use trans-Caspian routes, it will be necessary not only to modernize the ports, but also to build new container logistical centers. Another problem is the need to use additional marine transport.

Route 5: Urumqi – Aktau – Baku – Poti – Constanta. The route is the most expensive and has the least throughput capacity of all the routes described above; besides, it has been used very little, if at all. The cost of railroad cargo delivery is as high as US\$ 5,000.

This route will require the most significant outlays, including completion of construction of container facilities in Baku and port facilities in Poti, reconstruction of motorways, construction of tunnels and container logistical centers. Total required capital expenditures are estimated at not less than US\$ 8 billion. That figure combined with the need to transship cargoes at several ports makes the route basically useless.

Route 6: Urumqi – transit via Kazakhstan – Teheran (Iran). This route is much cheaper, and its throughput capacity is much higher. The cost of railroad cargo delivery is up to US\$ 1,700 per 1 TEU. Potential capacity of this route is one the highest among all routes described above, and stands at 300,000 TEUs.

Minimum target investments required to develop this route are estimated at US\$ 2 billion (source: Ministry of Transportation of Iran). Design of the route development program is still under way.

Table * contains the main characteristics of the routes described above.

Table *. SREB Transport corridors and their potential

Route	<i>Estimated route capacity, thousand TEUs</i>	Railroad Transportation Cost, \$/TEU	Potential Throughput Capacity Post-Modernization, thousand TEUs	Railroad Transportation Cost Post-Modernization, \$/TEU
Urumqi (XUAR) – Kazakhstan – Omsk – Moscow – EU	300	1300	1000	1000
Shanghai – Trans-Siberian Railroad - Brest	250	2200		1000
Urumqi – Aktau – Makhachkala – Novorossiysk – Constanta	100	4000	1000	1600
Urumqi – Aktau – Makhachkala – Tbilisi	50	3700		1600
Urumqi – Aktau – Baku – Poti – Constanta	50	5000		1500
Urumqi – transit via Kazakhstan – Iran	300	1700	1000	

Authors of the study come to a conclusion that transport corridors through Central Asia and Russia may potentially attract about 4% of total China – Europe marine cargo flows. Target export groups include a broad range of products manufactured in China's western provinces (mostly the Xinjiang Uyghur Autonomous Region, the Tibet Autonomous Region, and the Qinghai Province), and a limited selection of goods originating from its central and eastern provinces.

Implementation of development programs and satellite investment projects may increase the throughput capacity of SREB transport corridors to 3 million TEUs (which is about 13% of the current Eurasian container flow).

According to the study, the “ideal” outcome is one where up to 1 million TEUs will travel through Kazakhstan to Russia with subsequent partial delivery on to Europe (up to 30%), and another 1 million TEUs will transit through Aktau in the direction of Novorossiysk via Makhachkala to be evenly divided between the Russian and South-European markets.

The situation with the routes to and through the Caucasus is more complex. Transcaucasian countries do not consume much. Turkey, depending on cargo velocity and political situation, may accept cargoes from Novorossiysk and Iran. Besides, the cost of direct marine transportation to Istanbul and Izmir is too modest to expect that the Transcaucasian route will prove to be efficient even after multi-billion investments.

The study also points out that an important restriction exists: attainment of maximum cargo throughput capacity by the SREB routes will be contingent on the Kazakhstan transportation system becoming capable of digesting 3 million TEUs.

Kazakhstan already has the required basic infrastructure (railroads, motorways, ports) in place. However, there is a major shortage of technological superstructures – modern container processing centers, customs terminals, and related logistical services. Qualified staff is also in short supply. Taken together, those factors constitute a critical infrastructural barrier preventing any major increase of cargo flows in Central Asia.

Eurasian overland routes: conditions for being competitive

The Euro-Asian transport network transport system is mainly already formed. The main routes are demonstrating the practical capability of expensive and time-sensitive cargoes delivery serving as a complement to maritime routes.

For objective reasons the Euro-Asian land bridge likely will never compete in volume with maritime routes. But it may well establish itself as a complement to shipping services increasing the reliability of high-value and time-sensitive supply chains.

The current crisis situation has its negative impact on Euro-Asian overland links in several aspects:

- the general slow-down of transport demand;
- decreasing of the “critical mass” of traffic in landbridge corridors to keep the transport services across them sustainable;
- limitations of the investment potential for infrastructure projects implementation;
- growing gap between the shipping rates and the railway rates (which is one of the main disadvantages of the Euro-Asian landbridge).

At the same time, the current situation has some potential opportunities for the EATL transport routes development.

A portion of time-sensitive transit can be redirected through inland EATL routes due to “slow steaming” introduction on the maritime routes. Besides that, such events as the start of New Silk Way initiative, Creation of the Customs Union between the Russian Federation, Belarus and Kazakhstan, accession of the Russian Federation, Tajikistan and Kazakhstan to WTO improve the general political-economic climate across the EATL area.

EATL transport routes combine the functions and features of different types of transport corridors: transport and trade transit corridors, access corridors and developing corridors. On one hand, this gives wide opportunities to EATL countries; on another, very important is a clear understanding of actual possibilities, costs, benefits and risks that particular projects mean to them and their partners who depend on each other in corridors’ development process.

Competition of transport corridors on the Euro-Asian continent is not about the simple choice between transport routes and/or transport modes. It is the competition of logistic decisions based on intermodal services and value-added services and focused at the needs of particular supply chains. Main supply chains requirements are regular services, high punctuality, flexible costs, value added services availability, delivery speed appropriate for certain types of cargo. These

requirements do not apply to particular sections of Euro-Asian routes, but to entire transport-logistic chains.

Decision making in supply chains, in particular – choosing the routes and modes - is made usually not by shippers themselves but by logistic operators: freight forwarders, 3 PL – providers, etc., who combine the understanding of the needs of particular supply chain with deep knowledge of transportation market and ability to put together the interests of numerous market players: carriers, terminal operators, infrastructure owners, etc.

Considering that, any transport route within the Eurasian continent will attract traffic and trade only being evaluated in the context of supply chains competition. No political decisions or investment projects developed beyond this context will be successful in this sense. For the same reasons the attempts to bind the freight flows within the corridors to particular fixed routes, points or to selected transport modes seem counterproductive.

Railway transport should play the leading role within the EATL transport links.

In the current situation competitive railway services in EATL transit corridors can develop under the following conditions:

- a) location of Asian terminal points in North-Western China
- b) location of European terminal points in Eastern Europe and
- c) existence of guaranteed flow of high-value and time-sensitive cargo (automotive parts, electronics, etc.) from one shipper or a limited group of “anchor” shippers as a basis for sustainable regular service. Besides, the service should be better operated not by pure railway carrier but by market-oriented logistic operator experienced in design of transport-logistic chains

The road transport within the EATL corridors should be harmonized with railway services and complete them rather than directly compete with rail. The following spheres look most reasonable: a) short-run cross border trade; b) long haul transportation on the lanes where railway links do not exist or can't provide effective services for certain commodities (perishable, expensive, etc.); c) “road section” of intermodal rail-road transport service.

For effective long-haul trucking it is important to provide the even weight/length limitations for road transport along the main EATL routes.

It appears that currently the role of logistic centers in the EATL links development is underestimated. Being created in the hubs of EATL network, logistic centers could play the role of modern market-oriented nodes of supply chains improving the competitiveness of the entire EATL system.

Regular monitoring of corridors functioning is necessary not only for political needs but also as an instrument used by logistic operators willing to arrange the best possible currently transport chain.

II.1.2. The United Nations Economic Commission for Europe (UNECE)

The United Nations Economic Commission for Europe (UNECE) was set up in 1947. UNECE's major aim is to promote pan-European economic integration. UNECE includes 56 member States in Europe, North America and Asia.

The UNECE has established 57 transport agreements and conventions which are negotiated by government representatives and become legally binding for countries which ratify or accede to them. These agreements and conventions create international safety and environmental standards and regulations for transport and for motor vehicles and their trailers, harmonize national regulations, make border crossings less complicated, and provide for the development of coherent infrastructure networks for road, rail and inland waterway transport.

There are four main transport network agreements aimed at the development of coherent networks for road, rail, inland waterways and combined transport respectively:

a) **The European Agreement on Main International Traffic Arteries (AGR)**, established in 1975, provides UNECE governments with the international legal framework for the construction and development of a coherent international road network with a view to developing international road transport and traffic throughout the UNECE region.

The AGR defines the E-road network, consisting of the arteries channeling major international road traffic flows in Europe, and the infrastructure parameters to which those arteries should conform. The AGR is constantly kept under review and updated whenever necessary to adapt it to new political and transport developments, such as the need for new roads in new States or those created by new traffic flows.

One of the major revisions was undertaken in order to include the international roads of the countries in the Caucasus and Central Asia. States that become Contracting Parties to the AGR commit themselves to its implementation, including the construction or upgrade of the E-roads in their territories, within the framework of their national investment programmes, although they are given complete latitude as to the timing for the completion of construction works.

To date, 37 UNECE Member States have become Contracting Parties to the AGR.

b) **The European Agreement on Main International Railway Lines (AGC)**, established in 1985, similarly provides the legal and technical framework for the development of a coherent international rail network in the region. The AGC identifies the rail lines of major international importance, the E-rail network, and defines the infrastructure parameters to which they should conform.

The Agreement comprises the main body of the Agreement plus:

- definition of a network of railway lines of major international importance and
- definition of infrastructure parameters.

The AGC is also revised whenever necessary to take account of political and transport changes in Europe. It has undergone a major revision in recent years also to include the international rail networks of the Caucasus and Central Asian countries.

Contracting Parties to the AGC commit themselves to its implementation, including the construction or the upgrade of the E-rail lines in their territories, within the framework of their national programmes but without any time constraints. To date, 27 UNECE Member States are Parties to the AGC.

c) **The European Agreement on Important International Combined Transport Lines and Related Installations (AGTC)**, established in 1991, provides the technical and legal framework for the development of efficient international combined road/rail transport infrastructure and services. Combined road/rail transport comprises the transport of containers, swap bodies and entire trucks on railway wagons to and from especially equipped terminals. The AGTC determines important European railway lines used for international combined transport, identifies all terminals, border crossing points, ferry links and other installations important for international combined transport services. It also establishes internationally acceptable infrastructure standards for those lines and related combined transport installations, and prescribes internationally acceptable performance parameters of trains and combined transport installations and equipment.

Contracting Parties to the AGTC commit themselves to its implementation, including the construction or the upgrade of the railway lines and related combined transport installations in their territories, within the framework of their national programmes but without any time constraints. To date, 32 UNECE Member States have become Parties to the AGTC.

d) **The European Agreement on Main Inland Waterways of International Importance (AGN)**, established in 1996, establishes the internationally agreed European network of inland waterways and ports as well as the uniform infrastructure and operational parameters to which they should conform. The geographical scope of the E-waterways network, consisting of navigable rivers, canals and coastal routes extends from the Atlantic to the Ural, connecting 37 countries and reaching beyond the European region.

By acceding to the AGN, governments commit themselves to the development and construction of their inland waterways and ports of international importance in accordance with the uniform conditions agreed upon and within their investment programmes. To date, 18 UNECE Member States have become Parties to the AGN.

These four international Agreements define respectively the E transport networks for different modes as well as the minimum technical requirements according to which the relevant infrastructures should be built. AGTC also includes operational parameters for combined transport services.

UNECE infrastructure agreements are the only Pan-European governmental basis for the long-term development of coherent international networks for the various modes of inland transport. As such, they were taken as a basis for the determination of the Pan-European transport corridors at the Pan-European Transport Conferences in Crete and Helsinki.

The E road and E rail networks represent the most useful basis for the identification of priority Euro-Asian transport corridors.

To ensure seamless connections throughout Europe, including access to markets, UNECE coordinates work on a Trans-European network for motorways (TEM) and rail (TER) in Central, Eastern and South-Eastern Europe.

The UNECE Trans-European Motorways (TEM) Project established in 1977 is a sub-regional cooperation among Central, Eastern and South Eastern European countries. The project is aimed to

facilitate road traffic in Europe, to improve the quality and efficiency of transport operations, to balance existing gaps and disparities between motorway networks in Western, Eastern, Central and South-Eastern Europe, and to assist the integration process of European transport infrastructure systems.

TEM is the backbone of the Pan-European Road Corridors in CEE and of the Transport Infrastructure Needs Assessment (TINA) exercise. Initial financial support was provided by the United Nations Development Programme (UNDP); the executing agency is UNECE. There are 15 TEM member countries: Armenia, Austria (associate member), Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Georgia, Hungary, Italy, Lithuania, Poland, Romania, Slovakia, Slovenia and Turkey. 4 other countries have observer status: Montenegro, Serbia, Sweden and Ukraine. Azerbaijani membership is currently pending, awaiting signature for accession.

The UNECE Trans-European Railway (TER) Project established in 1990 is a sub-regional cooperation among Central, Eastern and South-Eastern European countries. The project is aimed to improve the quality and efficiency of transport operations, to assist the integration process of European transport infrastructure systems, and to develop a coherent and efficient international railway and combined transport system in accordance with the UNECE Pan-European infrastructure agreements: European Agreement on Main International Railway Lines (AGC) and European Agreement on Important International Combined Transport Lines and Related Installations (AGTC).

Initial financial support was provided by the United Nations Development Programme (UNDP); the executing agency is UNECE

There are 17 member countries: Armenia, Austria, Bosnia and Herzegovina, Bulgaria, Croatia, Czech Republic, Georgia, Greece, Italy, Lithuania, Poland, Romania, Russian Federation, Serbia, Slovak Republic, Slovenia and Turkey. In addition, a number of observer countries participate in certain activities of the project: Belarus, Latvia, Moldova, Montenegro, The former Yugoslav Republic of Macedonia and Ukraine. Azerbaijani membership is pending, awaiting signature for accession

The execution of the TEM and TER projects is provided by the TEM and TER Master Plan which sets out the priority infrastructure needs, the backbone networks and a realistic investment plan to develop them.

The original Master Plan was published in 2006, presenting a reliable and pragmatic short-, medium- and long-term investment strategy for developing road, rail and combined transport backbone networks in the participating countries. The document was revised between 2008 and 2011 in order to analyze the results of road and rail infrastructure development, to describe the existing status of road and rail networks; and to set out their development programme until the year 2020.

The revised Master Plan counts for 191 rail and 512 road projects with total cost of 196,97 billion Euros.

Draft for information only

II.1.3. The United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP)

Made up of 53 Member States and 9 Associate Members, with a geographical scope that stretches from Turkey in the west to the Pacific island nation of Kiribati in the east, and from the Russian Federation in the north to New Zealand in the south, the region is home to 4.1 billion people, or two thirds of the world's population. This makes ESCAP the most comprehensive of the United Nations five regional commissions, and the largest United Nations body serving the Asia-Pacific region.

Established in 1947 with its headquarters in Bangkok, Thailand, ESCAP works to overcome some of the region's greatest challenges by providing results oriented projects, technical assistance and capacity building to member States in the areas of Sustainable Development, Macroeconomic Policy and Financing for Development, Trade, Investment and Innovation, Transport, Social Development, Environment and Development, Information and Communications Technology, Disaster Risk Reduction, Statistics, Sub-regional activities for development.

In the transport sector UNESCAP is supporting the following directions of development:

b) Asian Highway network. The Asian Highway network is a regional transport cooperation initiative aimed at enhancing the efficiency and development of the road infrastructure in Asia, supporting the development of Euro-Asia transport linkages and improving connectivity for landlocked countries.

c) Trans-Asian Railway network. The Trans-Asian Railway network now comprises 117,500 km of railway lines serving 28 member countries. Much like yesterday's Silk Road, today's Trans-Asian Railway aims to serve cultural exchanges and trade within Asia and between Asia and Europe. Recognizing that the network would reach its full operational capabilities through greater harmonization of standards and acknowledging the need for a regional framework to discuss related issues, Member States negotiated an Intergovernmental Agreement on the Trans-Asian Railway Network. The Agreement entered into force on 11 June 2009.

c) Intermodal regional network and dry ports. The Ministerial Conference on Transport held in the Republic of Korea in November 2006 noted that the Asian Highway and Trans-Asian Railway networks constituted two important building blocks for the realization of the vision of an international integrated intermodal transport and logistics system which the ESCAP region needs to serve new trade patterns. Ministers resolved to develop policies along a number of guiding principles which included giving priority to investment in the Asian Highway and Trans-Asian Railway networks, including intermodal interfaces, and promoting the development of economic and logistics activities at intermodal interfaces.

Reaping the benefits of intermodalism requires that these intermodal interfaces such as dry ports or inland container depots be planned carefully to serve as efficient cross-over points where freight can switch modes without delays or damage.

The organization works with its member States to strengthen connectivity, optimize the use of existing infrastructure and increase the level of integration between the different transport modes. In order to finance these transport infrastructure and systems, UNESCAP offers advice

on financing options and advocates public-private partnerships including network coordination, diagnostic workshops and online training materials and courses.

Project on Development of seamless rail-based intermodal transport services in Northeast and Central Asia for enhancing Euro-Asian transport linkages and its implementation.

The purpose of this project is to:

- (i) review transport documentation, conventions and procedures applying to intermodal cargo transport across maritime and land borders in the sub-region;
- (ii) identify problems related to border crossing efficiency which may be resolved by the streamlining and harmonization of existing documentation and procedures;
- (iii) recommend improvements to documentation and procedures with a view to eliminating delays to transport at seaports and land borders and contributing to smooth transport flows across borders.

Fact-finding missions to five participating countries of Northeast and Central Asia - Korea, China, Russian Federation, Mongolia and Kazakhstan - are to be conducted in April and May 2016 for the purpose of identifying current practices and problems with respect border crossing documentation and control.

The study was prepared by UNESCAP Secretariat on the basis of desk research and of data collected from freight forwarders and government officials and private sector on the applicable documentation and procedures. The study provides the analysis of the current situation and presents recommendations for the harmonization and improvement of documentation and procedures in this sub-region. In particular, it recommends the adoption of a new transport document which has been designed to accommodate all transport modes, including railways, which have been so far excluded from the coverage of multi-modal transport documents.

II.1.4. The United Nations Office of the High Representative for the Least Developed Countries, Landlocked Developing Countries and the Small Island Developing States (UN-OHRLLS)

The United Nations Office of the High Representative for the Least Developed Countries, Landlocked Developing Countries and the Small Island Developing States (UN-OHRLLS) was established by the United Nations General Assembly in 2001 through its resolution 56/227 with functions recommended by the Secretary-General in paragraph 17 of his report A/56/645.

The key functions of the OHRLLS are as follows:

- (a) To assist the Secretary-General in ensuring the full mobilization and coordination of all parts of the United Nations system, with a view to facilitating the coordinated implementation of and coherence in the follow-up and monitoring of the Programme of Action for the Least Developed Countries at the country, regional and global levels;
- (b) To provide coordinated support to the Economic and Social Council as well as the General Assembly in assessing progress and in conducting the annual review of the implementation of the Programme of Action;
- (c) To support, as appropriate, the coordinated follow-up of the implementation of the Global Framework This Global Framework has now been replaced by the Almaty Declaration and Programme of Action, 2003 for Transit Transport Cooperation between Landlocked and Transit Developing Countries and the Donor Community and the Programme of Action for the Sustainable Development of Small Island Developing States;
- (d) To undertake appropriate advocacy work in favour of the least developed countries, landlocked developing countries and small island developing States in partnership with the relevant parts of the United Nations as well as with the civil society, media, academia and foundations;
- (e) To assist in mobilizing international support and resources for the implementation of the Programme of Action for the Least Developed Countries and other programmes and initiatives for landlocked developing countries and small island developing States;
- (f) To provide appropriate support to group consultations of Least Developed Countries, Landlocked Developing Countries and Small Island Developing States.

In August, 2003, the International Ministerial Conference of Landlocked and Transit Developing Countries and Donor Countries on Transit Transport Cooperation (Almaty Ministerial Conference) was held in Almaty, Kazakhstan, setting the necessities of Landlocked and Transit Developing Countries in a universal document - Almaty Program of Action: "Addressing the Special Needs of Landlocked Developing Countries within a New Global Framework for Transit Transport Cooperation for Landlocked and Transit Developing Countries".

The general objectives of the Program were as follows:

- reduce customs processes and fees to minimize costs and transport delays;
- improve infrastructure with respect to existing preferences of local transport modes, where road should be focused in Africa and rail in South Asia;

- implement preferences for landlocked countries' commodities to boost their competitiveness in the international market;
- establish relationships between donor countries with landlocked and transit countries for technical, financial and policy improvements.

During the Second United Nations Conference on Landlocked Developing Countries that was held in 2014 in Vienna, Austria, a 10 year action-plan was adopted – the “Vienna Programme of Action for Landlocked Developing Countries for the Decade 2014-2024”.

The Vienna Programme is centered upon addressing the challenges faced by landlocked countries, aims to contribute to the eradication of poverty stemming from their landlockedness, through the implementation of specific actions in the priority areas identified by the document:

Priority 1: Fundamental transit policy issues

Priority 2: Infrastructure development and maintenance

(a) Transport infrastructure

(b) Energy and information and communications technology infrastructure

Priority 3: International trade and trade facilitation

(a) International trade

(b) Trade facilitation

Priority 4: Regional integration and cooperation

Priority 5: Structural economic transformation

Priority 6: Means of implementation

The main innovative feature of the Vienna Programme of Action is the particular focus to the development and expansion of efficient transit systems and transport development, enhancement of competitiveness, expansion of trade, structural transformation, regional cooperation, and the promotion of inclusive economic growth and sustainable development to reduce poverty, build resilience, bridge economic and social gaps and ultimately help transform those countries into land-linked countries.

<http://unohrlls.org/>

II.1.5. United Nations Conference on Trade and Development (UNCTAD)

The United Nations Conference on Trade and Development (UNCTAD), established in 1964, promotes the development-friendly integration of developing countries into the world economy by carrying out three key functions: operating as a forum for intergovernmental deliberations supported by discussions with experts and exchanges of experience for consensus building; undertaking research, policy analysis and data collection; and providing technical assistance to developing countries.

The objective of the Division on Technology and Logistics is to enhance the economic development and competitiveness of developing countries through efficient trade logistics services, transit transport systems, increased access to and sustainable utilization of information and communication technology, and training and capacity-building programmes for local institutions.

As part of the preparatory process of the midterm review of the Almaty Programme of Action, the UNCTAD Expert Meeting held in 2007 provided a forum to explore models and best practices to improve international transit transport operations based on practical solutions with a view to enhancing transit transport for the benefit of landlocked and transit developing countries.

In July 2008, UNCTAD organized a global preparatory meeting on the midterm review of the Almaty Programme of Action to affirm progress on the implementation of trade facilitation for the benefit of landlocked and transit developing countries.

Responding to the specific problems of LLDCs requires a multidimensional approach to landlockedness as a development challenge. This notably implies the implementation of policies and measures aimed at economic restructuring and specialization in these countries that take into account their transport-related obstacles. The development of productive capacities is a key element of this process.

In this context, UNCTAD supports LLDCs to tackle persisting and emerging challenges by providing advisory services and organizing high-level expert group meetings, among others to address key challenges facing these countries. Among the main outputs are:

- preparation of policy-focused studies at the request of LLDCs;
- supporting LLDCs to attract Foreign Direct Investments

<http://unctad.org/en/Pages/ALDC/Landlocked%20Developing%20Countries/UN-recognition-of-the-problems-of-land-locked-developing-countries.aspx>

II.1.6. United Nations Special Programme for the Economies of Central Asia (UN SPECA)

The United Nations Special Programme for the Economies of Central Asia (SPECA), a joint UNECE-UNESCAP initiative, was launched in 1998 to address challenges faced by Central Asian countries. It particularly aims to strengthen sub-regional cooperation and integrate the region into the world economy..

Thematic Working Group on Sustainable Transport, Transit and Connectivity (TWG-STTC) is a subsidiary body of SPECA. It focuses on developing new, and extending existing, road and rail networks in the region, as well as implementing the Programme of action resulting from the Almaty declaration of Land-Locked and Transit Developing Countries.

SPECA Project Working Group on Transport focuses on the development of [Euro-Asian transport linkages](#), including the possible extension of the [TER](#) and [TEM](#) networks into the region. It plays an active role in the implementation of Vienna Program of Action for Landlocked Developing Countries for the Decade 2014-2024. The activities of the SPECA Project Working Group on transport is supported by the UNECE and UNESCAP in a coordinated and mutually reinforcing way.

The SPECA Governing Council on its tenth session in November 2015 decided to change the title from “Project Working Group on Transport and Border Crossing” to the “Thematic Working Group on Sustainable Transport, Transit and Connectivity” (TWG-STTC) with new objectives added in line with the 2030 Sustainable Development Agenda adopted by the United Nations Sustainable Development Summit 2015 and the commitment to its implementation, including the achievement of the Sustainable Development Goals (SDGs). The 201 session of SPECA Governing Council in Ashgabat confirmed a strong potential of SPECA for supporting and facilitating the achievement of the SDGs. The SPECA framework, including its Governing Council, Economic Forums, and Working Groups can provide an important platform for supporting progress towards many of the SDGs through the exchange of best practice, capacity-building, joint development and implementation of regional projects and the sharing of experience on the use of new financial mechanisms and partnerships.

Member-states:	Afghanistan, Azerbaijan, Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan and Uzbekistan.
Priorities that are most important for the EATL development	<ul style="list-style-type: none">• Implementation of international transport conventions and agreements;• Establishment and operation of national coordinating mechanisms for transport facilitation;• Identification and elimination of major bottlenecks along international transport routes;• Creation of transport database;• Establishment and strengthening of public-private partnerships;• Road safety improvement;• SDGs implementation

The TWG will facilitate policy discussions on strategic issues on strengthening regional cooperation and integration through enhanced transport connectivity and collection and dissemination of transport statistics with special focus on implementation of sustainable development goals. More specifically, the TWG’s activity aimed to:

- oversee the implementation of transport-related activities and initiatives at national and subregional level, including development of road and railway networks, dry ports as well as facilitate intermodal transport in SPECA countries;
- support the establishment and operation of national coordinating mechanisms for transport facilitation;
- facilitate the implementation of ESCAP agreements in transport such as the intergovernmental agreements on Asian Highway, Trans-Asian Railway and Dry Ports;
- assist in identification and elimination of major bottlenecks along international transport routes in SPECA region and beyond;
- facilitate the development of the SPECA TWG special database on transport and border crossing activities for the SPECA countries as well as collection of transport statistics;
- promote public-private partnerships in the SPECA region and innovative financing mechanism for transport infrastructure development;
- work towards improving road safety to reduce road traffic fatalities and casualties in the SPECA region;
- support the efforts of the participating countries to implement 2030 development agenda by enhancing the sustainability of transport;
- ensure more focus on those efforts which would result in strengthening regional cooperation aimed at achieving transport related SDGs;
- serve as a forum for inland transport stakeholders to discuss strategic issues, exchange of experiences, lessons learned and good practice, as well as for national and subregional efforts in transport sector related to increasing sustainability of transport and achieving SDGs;
- develop and implement transport projects, when possible, in line with relevant SDGs and targets to contribute to 2030 development agenda;

Draft for information only

II.1.7. European Union initiatives

The European Commission aims to develop and promote transport policies that are efficient, safe, secure and sustainable, to create the conditions for a competitive industry that generates jobs and prosperity.

As of January 2014, the EU has a new transport infrastructure policy that will connect the continent from east to west, north to south. This policy aims to close the gaps between national transport networks, remove bottlenecks that still hamper the smooth functioning of the single market and overcome technical barriers such as incompatible standards for rail traffic.

The trans-European transport network, or TEN-T, is a longstanding project to modernize and 'knit together' today's patchwork of national parts into a smooth-running transport network.

With the TEN-T, the EU plans to establish a core transport network by 2030, filling in missing cross-border links and making the network 'smarter', with deadlines to make sure that all projects contributing to the core network are implemented as a priority.

Currently nine core network corridors are identified, based on their added value for TEN-T development and their maturity status. Core network corridors were introduced to facilitate the coordinated implementation of the core network. They bring together public and private resources and concentrate EU support from the CEF, particularly to remove bottlenecks, build missing cross-border connections and promote modal integration and interoperability.

One of the EU constant priorities is the development of effective transport links with their Eastern and Southern neighbor states and, via them – with countries of Central and Eastern Asia.

The regional EU-assistance in transport benefitting the eastern neighbors is channeled, in particular, under the TRACECA-programme, an acronym referring to Transport Corridor Europe-Caucasus-Asia. This EU programme was launched in 1993 to develop a transport corridor from Europe to China, via the Black Sea, the Caucasus, the Caspian Sea and Central Asia (see p. ***).

In 2009 EU and six partner countries (Armenia, Azerbaijan, Belarus, Georgia, the Republic of Moldova and Ukraine) established the Eastern Partnership (EaP), a joint initiative building also on bilateral relations. This cooperation has a certain transportation aspect – the EaP Transport Panel which is a framework for exchange of information and best practice between the partner countries and the EU Member States. Its goal is to strengthen transport connections both between the partner countries and the EU and between partner countries themselves. It addresses reforms underpinning regulatory convergence across transport modes. Policy work conducted in this area includes certain transportation issues, in particular:

The EaP regional transport network (approved 2013 and included in the indicative TEN-T maps);

Regulatory convergence, which became a priority notably for countries having signed Association Agreements with the EU;

Regional transport cooperation and capacity building actions in all transport modes.

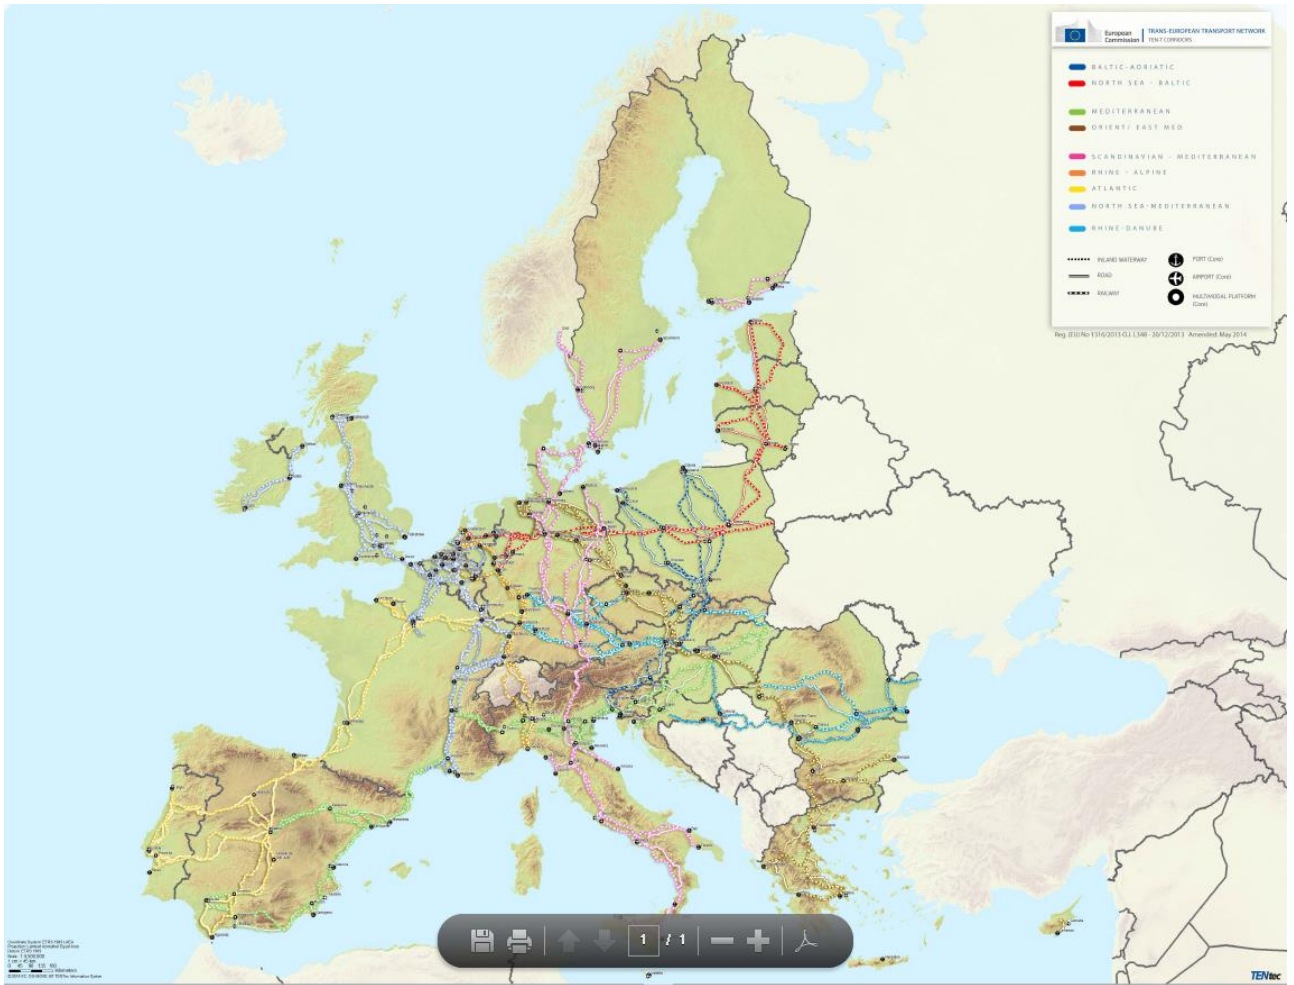

Figure *. Map of TEN-T corridors

http://europa.eu/pol/trans/index_en.htm

II.1.8. Eurasian Economic Union (EAEU)

The Eurasian Economic Union is an international organization established in 2014 for regional economic integration. It has international legal personality and is established by the Treaty on the Eurasian Economic Union.

The Member-States of the Eurasian Economic Union are the Republic of Armenia, the Republic of Belarus, the Republic of Kazakhstan, the Kyrgyz Republic and the Russian Federation.

The EAEU provides for free movement of goods, services, capital and labor, pursues coordinated, harmonized and single policy in the sectors determined by the Treaty and international agreements within the Union.

Transportation is among the priorities of the integration process within the Union. Integration in the spheres of transport and natural monopolies (railways among them) are embodied in Section XIX «Natural Monopolies» and Section XXI «Transport» of the Treaty on the Union.

According to the Treaty on the EAEU, the Union shall conduct coordinated (agreed) transport policy aimed at economic integration, consistent and gradual establishment of a Common Transport Area.

Common Transport Area means a range of transport systems of Member States providing for free movement of vehicles, passengers and cargo as well as vehicle compatibility based on the harmonized transport legislation of Member States.

Member States shall develop coordinated (agreed) transport policy.

The Main Directions and Implementation Stages of the Coordinated (Agreed) Transport Policy of the Eurasian Economic Union are supposed to be approved by the Supreme Eurasian Economic Council by the end of 2016.

Eurasian Economic Commission is the Permanent regulatory body of the EAEU. Its main functions in the transport sphere are as follows:

- developing proposals on economic integration in transport sphere;
- developing proposals for transport legislation harmonization of the Union Member States;
- monitoring implementation of the Coordinated (Agreed) Transport Policy by the Member States;
- coordinating work on identification and elimination of exemptions, limitations and barriers to the functioning of the internal Union transport market;
- conducting comparative analysis of the Member States regulation of transport natural monopoly entities;
- promoting harmonization in natural monopolies regulation regarding environmental issues and energy efficiency.

Figure *. Main roads and railway routes on the territory of the EAEU Member States

<http://eec.eaeunion.org/en/Pages/default.aspx>

II.1.9. New Silk Way - Belt and Road Initiative

The refers to the Silk Road Economic Belt and 21st Century Maritime Silk Road, a significant development strategy launched by the Chinese government with the intention of promoting economic co-operation among countries along the proposed Belt and Road routes. The Initiative has been designed to enhance the orderly free flow of economic factors and the efficient allocation of resources. It is also intended to further market integration and create a regional economic co-operation framework of benefit to all.

The National Development and Reform Commission (NDRC) issued its Vision and Actions on Jointly Building the Silk Road Economic Belt and 21st Century Maritime Silk Road on 28 March 2015. This outlined the framework, key areas of co-operation and co-operation mechanisms with regard to the Belt and Road Initiative.

The Belt and Road Initiative upholds the principles of jointly developing the programme through consultation with all interested parties. Existing bilateral and multilateral co-operation mechanisms will be utilized to promote the integration of the development strategies of the countries along the route. Steps will be taken to advance the signing of co-operation memorandums of understanding or co-operation plans for the establishment of a number of bilateral co-operation demonstration projects. Efforts will also be made to set up a sound bilateral joint work mechanism, and to devise an implementation plan and action roadmap for advancing the Belt and Road strategy.

The US\$40 billion Silk Road Fund has been established to finance the Belt and Road Initiative. It will invest mainly in infrastructure and resources, as well as in industrial and financial cooperation. The Fund was set up as a limited liability company in December 2014 with its founding shareholders including China's State Administration of Foreign Exchange, the China Investment Corp, the Export-Import Bank of China and the China Development Bank.

The new multilateral development bank - Asian Infrastructure Investment Bank (AIIB) has been set up with a view to complementing and cooperating with the existing MDBs in order to address infrastructure needs in Asia. AIIB will focus on the development of infrastructure and other productive sectors in Asia, including energy and power, transportation and telecommunications, rural infrastructure and agriculture development, water supply and sanitation, environmental protection, urban development and logistics.

Transportwise the Belt and Road Initiative aims to connect Asia, Europe and Africa along five routes. The Silk Road Economic Belt focusses on: (1) linking China to Europe through Central Asia and Russia; (2) connecting China with the Middle East through Central Asia; and (3) bringing together China and Southeast Asia, South Asia and the Indian Ocean. The 21st Century Maritime Silk Road, meanwhile, focusses on using Chinese coastal ports to: (4) link China with Europe through the South China Sea and Indian Ocean; and (5) connect China with the South Pacific Ocean through the South China Sea.

Focusing on the above mentioned five routes, the Belt and Road will take advantage of international transport routes as well as core cities and key ports to further strengthen collaboration and build six international economic co-operation corridors. These have been identified as the New Eurasia Land Bridge, China-Mongolia-Russia, China-Central Asia-West Asia, China-Indochina Peninsula, China-Pakistan, and Bangladesh-China-India-Myanmar.

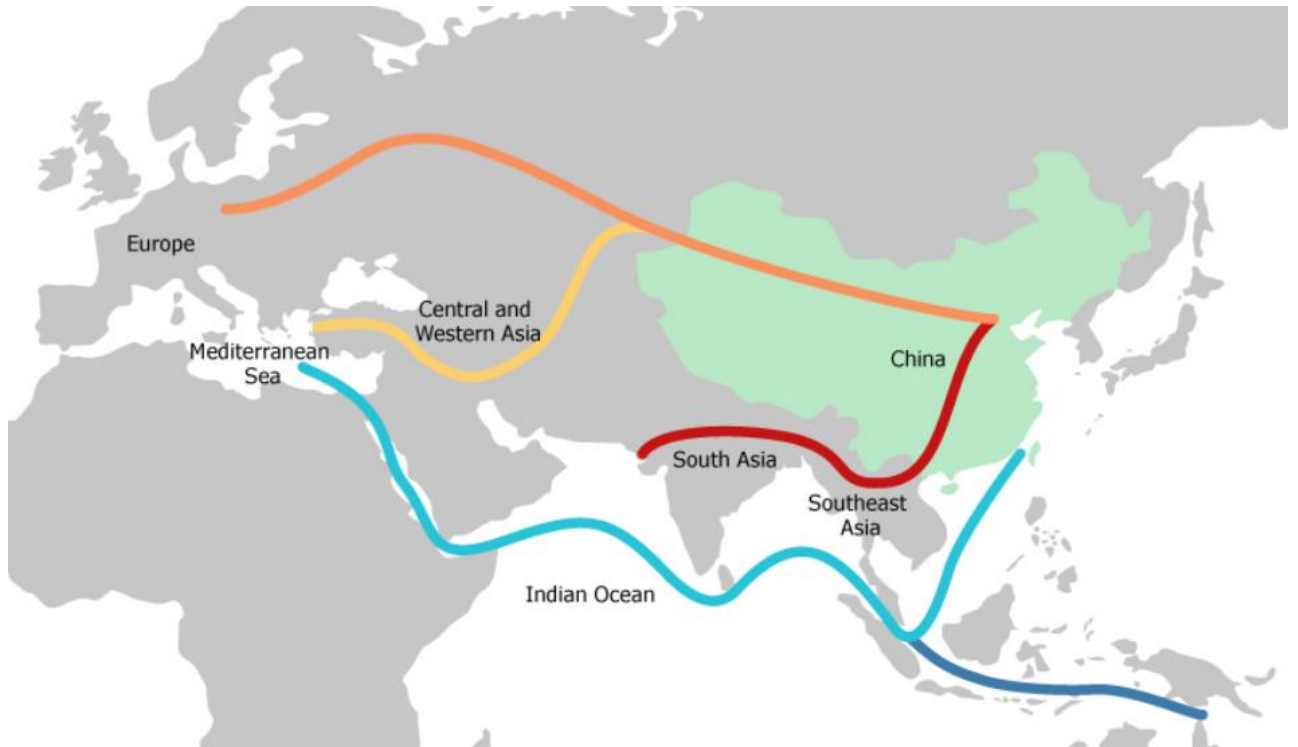

Figure *.Silk Road Economic Belt and the 21st Century Maritime Silk Road corridors as described in the *Vision and Actions on Jointly building the Silk Road Economic Belt and 21-st Century Maritime Silk Road* document

<http://beltandroad.hktdc.com/en/about-the-belt-and-road-initiative/about-the-belt-and-road-initiative.aspx>

II.1.10. Organization for Security and Co-operation in Europe (OSCE)

The Organization for Security and Co-operation in Europe (OSCE) has a comprehensive approach to security that encompasses politico-military, economic and environmental, and human aspects. It therefore addresses a wide range of security-related concerns, including arms control, confidence- and security-building measures, human rights, national minorities, democratization, policing strategies, counter-terrorism and economic and environmental activities. All 57 participating States enjoy equal status, and decisions are taken by consensus on a politically, but not legally binding basis.

Transport related issues have been high on the OSCE's agenda in the Economic and Environmental Dimension in recent years. In the field of transport the Office of the Coordinator of OSCE Economic and Environmental Activities (OCEEA), together with the OSCE field operations, continue to implement the relevant Ministerial Council Decisions adopted over the past years, namely MC Decision No. 11/06 on Future Transport Dialogue in the OSCE (Brussels, 2006), MC Decision No. 9/08 on Follow-Up to the Sixteenth Economic and Environmental Forum on Maritime and Inland Waterways Co-operation (Helsinki, 2008) and the most recent MC Decision No. 11/11 on Strengthening Transport Dialogue in the OSCE (Vilnius, 2011).

Based on these documents, the OCEEA and partner organizations such as the United Nations Economic Commission for Europe (UNECE) Transport Division and the World Customs Organization (WCO) are engaged in activities described below.

The security of inland transport. This issue has been noted as the weakest in the global supply chain. Relative to seaports and airports, many consider inland transportation to be under-protected. The OSCE has responded by promoting a comprehensive, integrated approach towards inland transport security taking into account the views and concerns of various stakeholders.

Good governance and anti-corruption. The OCEEA assists participating States by providing capacity building and regional training activities aimed at combating corruption in customs and other border services. In carrying out these activities, the OCEEA aims to raise awareness of the existing tools to fight corruption in border services and to work with participating States to identify concrete national follow-up activities in this field.

International legal instruments. The OCEEA assists participating States in organizing regional training activities and national seminars to discuss the implementation of the following international legal instruments in Eastern and South-Eastern Europe, the South Caucasus and Central Asia: United Nations Economic Commission for Europe (UNECE) International Convention on the Harmonization of Frontier Control of Goods ('Harmonization Convention'); World Customs Organization (WCO) revised Kyoto Convention on the Simplification and Harmonization of Customs Procedures; World Customs Organization (WCO) SAFE Framework of Standards to Secure and Facilitate Global Trade.

Assistance to Landlocked Developing Countries. Out of 31 landlocked developing countries globally, nine are OSCE participating States or Partners for Co-operation. The specific transport challenges landlocked developing countries face include lack of direct access to deep water ports and a high level of dependence on the transit services of non-landlocked neighbors. Addressing those challenges requires the development of efficient transport systems through genuine public and private partnerships between landlocked and transit countries and their development

partners. While the international donor community, including financial and development institutions and donor countries, have a major role to play in providing financial and technical support for the construction of transport infrastructure, the OSCE has focused on tackling non-physical obstacles to trade and transport. Since 2006 the OSCE has provided political and financial support to the UNECE's Euro-Asian Transport Links Project (Phases I and II).

OSCE-UNECE Handbook of Best Practices at Border Crossings. In February 2012, the OCEEA and the Transport Division of the United Nations Economic Commission for Europe (UNECE) jointly released a OSCE-UNECE Handbook of Best Practices at Border Crossings – A Trade and Transport Facilitation Perspective. The handbook aims to assist OSCE participating States/ UNECE member States, particularly those which are landlocked developing countries with limited access to world markets, in developing more efficient border, transport and customs policies. The publication provides an overview of a range of reference materials and over 120 best practice examples. It covers areas such as available legal instruments, inter-agency and international co-operation, balancing security and facilitation measures, freight processing, risk management, border crossing point design, ICT technology use, human resource management and benchmarking.

Draft for information

II.1.11. Organization for Cooperation of Railways (OSJD)

The Organization for Cooperation of Railways (OSJD) was established in 1956 by the railway administrations of the 'Eastern Block' countries to create and improve the coordination of international rail transport. Concerning especially the transports between Europe and Asia, it has helped develop cooperation between railways and with other international organizations.

Member-states:	<p>Azerbaijan, Albania, Afghanistan, Belarus, Bulgaria, Hungary, Vietnam, Georgia, Iran, Kazakhstan, China, Democratic People's Republic of Korea, Cuba, Kyrgyzstan, Latvia, Lithuania, Moldova, Mongolia, Poland, Russia, Romania, Slovakia, Tajikistan, Turkmenistan, Uzbekistan, Ukraine, Czech Republic, Estonia.</p> <p>Apart from them, OSJD incorporates 7 railways with observer status from: France (SNCF), Germany (DB AG), Finland (VR), Serbia (ZS), Greece (OSE), Austrian-Hungarian company "GySEV", Federal Passenger Company (FPC JSC, Russia).</p>
Priorities that are most important for the EATL development	<ul style="list-style-type: none"> • Development and improvement of international railway transportation with the traffic between Europe and Asia, including combined transportation; • Development of consentaneous transport policy in the field of international railway traffic; • Improvement of international transport law, administration of the Convention concerning International Goods Traffic by Rail (SMGS) and other legal documents connected with the international railway traffic; • Co-operation on the solution of the problems connected with the economic, information, scientific, technological and ecological aspects of railway transport; • Development of measures aimed at the increase of railway transport competitiveness; • Co-operation in the field of railway operation and technical matters connected with further development of international railway traffic; • collaboration with other international organizations, engaged in railway transportation matters, including those of combined transport.

In 1996, 13 main railway routes between Europe and Asia were identified by the OSJD on the basis of flows of goods between countries on the two continents. On a permanent basis the OSJD performs an analysis of technical and operational indicators and technical equipment of these 13 corridors, collected data on infrastructure and border crossings and studied ways of improving the freight transport technology. This work resulted in comprehensive measures being drafted to improve the organization of international rail transport operations along the transport corridors between Europe and Asia.

The XLIII session of the OSJD Ministerial Conference (Ulan-Bator, Mongolia, June 2-5, 2015) approved Comprehensive plans of carriage improvement and development of OSJD Railway Transport Corridors Nos. 4, 6 and 11 for a period up to 2020 and reported on the progress of the related comprehensive plans for transport corridors Nos. 9, 12 and 13.

The map of the OSJD corridors is presented on Fig.*

The interested countries signed memoranda of understanding for the development of these corridors, which served as a basis for coordinated actions by States to reorganize and modernize pertinent railway lines.

Figure*/. OSJD railway transport corridors

One of the projects initiated by OSJD aimed to improve the conditions of Euro-Asian railway transportation is the CIM/SMGS consignment note. This single transport document combines the required CIM and SMGS contracts of carriage into one paper.

The customs authorities officially recognize this document of carriage. The document is valid in the EU/EFTA customs area as transit declaration T and also in the SMGS regime as a national customs (transit) document. The CIM/SMGS consignment note can not only be used for wagonload services, but also for Combined Transport.

Using the new consignment note means documents no longer have to be changed at border crossings between two legal jurisdictions, dispensing with a great deal of administrative expenditure: a first step towards being able to provide through service for freight transport with just minimal border stops.

The development of the action plan on implementation of the Memorandum on cooperation in the technical, operational and commercial development of OSJD railway transport corridors Nos. 1-13 was continued:

The first meeting between the members states of OSJD railway transport corridor No. 1 regarding implementation of the provisions of the memorandum was held in Moscow (Russia Federation) on March 4, 2015. Special attention was paid to the creation of the Coordination Committee.

As part of the panel meeting (April 7-10, 2015, Kishinev, Republic of Moldova), a meeting between the member countries of OSJD railway transport corridors Nos. 12 and 13 was held on the implementation of the provisions of the Memorandum. Special attention was paid at these meetings to the creation of the Coordination Board that should be focused on the analysis of the parameters of the railway infrastructure of the border cross points and preparation of the plan of the infrastructure development and improvement. The analysis of the key components of the

Comprehensive Plan of development of the corridors should make a basis for balanced development of the sections of the corridors.

To improve the efficiency of the OSJD railway transport corridors, the experts studied the possibilities of connection of the new lines to the OSJD railway transport corridors, in particular:

- at the suggestion of the Republic of Moldova, the member states of OSJD railway transport corridor No. 12 and Ukraine have agreed to extend OSJD railway transport corridor No. 12 in the territory of the Republic of Moldova from Ocnița station to Vălcineț station and then in the territory of Ukraine to Zhmerinka station subject to preservation of the current crossing capacity in the territory of Ukraine at this stage. The relevant changes in OSJD railway transport corridor No. 12 were approved at the annual meeting of the OSJD Commission on Transport Policy and Development Strategy (October 6-9, 2015, the OSJD Committee).

Besides, the member states of railway transport corridors Nos. 2, 5, 8 and 10 accepted the proposal made by the Republic of Kazakhstan on connection of the following railway lines:

- Iletsk – Kabdygash – Nikeltau – Tobol as a branch line of OSJD railway transport corridor No. 2;
- Zhetygen – Altynkol as a branch line of OSJD Railway Transport Corridor No. 5;
- Beyneu – Uzen – Bolashak OSJD Transport Corridor No. 8;
- Dostyk – Mointy – Zhezkazgan – Saksaulskaya – Beyneu – Aktau-Port OSJD railway transport corridor No. 10.

In this connection, a resolution was passed to update the Comprehensive plans on improvement of the railway operations and development of OSJD railway transport corridors Nos. 2, 5, 8, 10 and 12 up to 2020, as well as the engineering and operational documentation of OSJD Transport Corridors Nos. 2, 5, 8, 10 and 12, and to amend the Memorandum on cooperation in the engineering, operational and commercial development of the OSJD railway transport corridors with regard to the above mentioned corridors.

Ukraine informed the OSJD Committee that the initiative connect port Odessa, port Ilyichyevsk (Ukraine), through the territory of Belarus, with port Klaipeda (Lithuania) was supported by the Byelorussian Railway and the Lithuanian Railways, and suggested that existing OSJD railway transport corridor No. 9 should be extended. The working bodies of the OSJD Commission on Transport Policy and Development Strategy commenced the work on this question on the basis of the OSJD regulatory documents.

Pursuant to the resolution of the OSJD Ministerial Conference, the representatives of the OSJD member states took part in the second joint discussion group on interaction of the OSJD railway transport corridors held in Brussels (Belgium) on June 18 – 19, 2015. The discussion group was also attended by the representatives of the EC railway freight corridors, the OSJD Committee, DG MOVE and other international organisations concerned. A number of agreements was reached on further cooperation between OSJD and DG MOVE with regard to the development of the OSJD transport corridors and EC railway freight corridors and the interchange of experience to enhance the competitive power of the railway operations.

Besides, as part of this sub-subject, a meeting of the representatives of the OSJD member states and member states of EC railway freight corridors No. 8 was held on October 13, 2015 at the suggestion of Bureau on control of this EC corridor.

The activity of OSJD Commission on Freight Traffic in 2015 was carried out in the following directions:

- updating the existing international agreements and contracts in the field of combined transportation between Europe and Asia;
- implementing tariff conditions in regard to the transit freight transportation;
- updating the existing rules on common use of freight wagons in the international traffic for the purpose of ensuring their harmonization with similar international regulating documents;
- harmonising the uniform system of cargo classification and coding;
- planning and organising container block trains between Europe and Asia, including combined transport;
- practical implementation of uniform CIM/SMGS consignments notes in the rail transport between Europe and Asia;
- cooperation with the international organizations in the aim to increase the efficiency and competitiveness of the international railway transport and modal shift from other modes of transport.

Draft for information only

II.1.12. Organization of the Black Sea Economic Cooperation (BSEC)

The Organization of the Black Sea Economic Cooperation (BSEC) was established in 1999 to foster interaction and to ensure peace, stability and prosperity among its Member States. The membership of BSEC currently includes Albania, Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Moldova, Romania, Russia, Serbia, Turkey, Ukraine.

Since its inception, BSEC paid special attention to cooperation in transport focusing mainly on how to utilize effectively intra-region capacity and growing transit potential of the Black Sea region. At the Meeting of the Ministers of Transport of the BSEC Member States in 2005, it was concluded that the development of transport axes connecting the Trans-European Transport Network with the Black Sea transport network should be based on the Euro-Asian transport corridors and on the major routes under the UNECE-UNESCAP EATL framework as well as on other international agreements and initiatives.

BSEC has the Working Group on Transport has its regular meetings and it carries out its functions as a working organ of cooperation in transport sphere.

The meetings of the Ministers of Transport of the BSEC Member State constitute de-facto a decision making regular high-level transport forum with its mechanism of implementation - working group, steering committees and expert groups. BSEC developed some important mutually supplemented projects in the region.

Cooperation on the gradual liberalization of transportation is going on within the Memorandum of Understanding on Facilitation of Road Transport of Goods in the BSEC Region (signed in Kyiv in 2002). The work on the MoU was institutionalized – the Steering Committee on Facilitation of Road Transport of Goods was established. The BSEC Permanent International Secretariat (PERMIS) carries out the duty of its secretariat. This work is being done in a close cooperation and with valuable support of the International Road Transport Union (IRU) and the Union of the Road Transport Association in the BSEC region (BSEC-URTA). The Steering Committee works on the issues of gradual liberalization of transport permit system, monitoring of border waiting times, introduction of the International Vehicle Weight Certificate, harmonization of charging policies etc.

Cooperation on the development of road infrastructure was established within the Memorandum of Understanding for the Coordinated Development of the Black Sea Ring Highway (signed in Belgrade on 19 April 2007). The work on the project was institutionalized – the Steering Committee as a main driving force, and Joint Permanent Technical Secretariat were established.

Development of maritime infrastructure and links is under way within the Memorandum of Understanding on the Development of the Motorways of the Sea at the BSEC Region (signed in Belgrade on 19 April 2007). The Cooperation was also institutionalized - it is coordinated by the Ad Hoc Working Group pertaining to this Memorandum of Understanding.

The projects also constitute regional contribution to the extension of Trans-European Networks and the development of Euro-Asian transport links. In the meantime, parallel to its work on these projects, BSEC, as a project-oriented organization, continue exploring new areas where it is desirable and realistic to develop and deepen multilateral cooperation in a regional format in the transport sphere, which carries particular prominence for the BSEC Organization. In this work special attention is paid to cooperation with other international organizations such as UNECE,

UNDP, IRU, IRF and BSEC sectoral dialogue partners, BRASS, BASPA, BINSAs and BSEC-URTA.

BSEC has worked collaboratively with UNECE on issues related to transport facilitation. The Cooperation Agreement between BSEC and UNECE, signed in 2001, aims at accelerating the development of international transport infrastructure networks, transport and border-crossing facilitation, and also harmonizing safety and environment standards in the area of transport.

<http://www.bsec-organization.org/aoc/Transport/Pages/Information.aspx>

Draft for information only

II.1.13. TRACECA Intergovernmental Commission

The Transport Corridor Europe-Caucasus-Asia (TRACECA) programme was launched at a conference in Brussels in 1993 which brought together trade and transport ministers from the original eight TRACECA countries (five Central Asian republics and three Caucasian republics). Currently TRACECA members include Armenia, Azerbaijan, Bulgaria, Georgia, Kazakhstan, Kyrgyz Republic, Moldova, Romania, Tajikistan, Turkey, Turkmenistan, Ukraine, and Uzbekistan.

At the Brussels conference, it was agreed to implement a program of a European Union funded technical assistance to develop a transport corridor on a west-east axis from Europe, across the Black Sea, through the Caucasus and the Caspian Sea to Central Asia.

In 2000, an Intergovernmental Commission (IGC) was established to oversee the implementation of the programme. The Commission's executive body, the Permanent Secretariat (PS), created in 2001, has its headquarters in Baku and is since 2006 funded directly through contributions of the TRACECA member countries.

In 2004 the Baku Initiative on Transport was launched involving all 1998 TRACECA MLA signatory states as well as Belarus.

One of the first activities of this initiative was to set up four expert working groups to work out recommendations on transport development in the fields of land transport (road / rail), aviation, security, and infrastructure. These recommendations were presented at the Second Baku Initiative Ministerial Conference and Fifth Annual Meeting of the IGC TRACECA in May 2006 which, in turn, approved the TRACECA long-term strategy till 2015.

The present Action Plan is based on the provisions of the strategy elaborated for the TRACECA corridor region for the period up to 2015. The latter's overall goal is to help deliver a sustainable, efficient and integrated multi-modal transport system between the EU and the TRACECA region but also among the TRACECA countries.

Currently the TRACECA countries are gradually implementing the IGC TRACECA Strategy for development of the international transport Europe-Caucasus-Asia corridor for the period up to 2015, aimed at creation of a sustainable infrastructure chain ensuring multi-modal transport with step-by-step integration of the corridor into the Trans-European Transport Networks (TENs).

II.1.14. Economic Cooperation Organization (ECO)

The Economic Cooperation Organization (ECO) is an intergovernmental organization established in 1985 by Iran, Pakistan, and Turkey to promote economic, technical, and cultural cooperation among the member states. In 1992, the Organization was expanded to include seven new members, namely: Afghanistan, Azerbaijan, Kazakhstan, Kyrgyz Republic, Tajikistan, Turkmenistan, and Uzbekistan.

The main goals of the ECO include sustainable economic development, economic liberalization and privatization, mutually beneficial cooperation with regional and international organizations, the removal of trade barriers, and the development of transport and communications infrastructure.

The transport and communications sector, since the early years of ECO, is on the top of the agenda. The ECO Directorate of Transport and Communications has played a significant role in facilitating ECO Agreements and Declarations in the transport and communications field to foster economic cooperation, integration and cohesiveness in the ECO region.

Key documents in this field are: the Quetta Plan of Action; the Istanbul Declaration (ECO Long Term Perspectives); the Almaty Outline Plan for the Development of Transport Sector in the ECO region; the Ashgabat Declaration of 1997; the Programme of Action for ECO Decade of Transport and Communications; and the Transit Transport Framework Agreement.

The ECO transport sector has achieved considerable progress in, for example, interconnecting road and railway networks in Central Asian Republics with Iran, Pakistan and Turkey, and in international road transport among all ECO countries via bilateral agreements and the construction of missing links in the ECO region.

II.1.15. Organization for Democracy and Economic Development - GUAM

Draft for information only

II.1.16. The World Bank

The World Bank is an international institution established in 1944 and providing financial and technical assistance to developing countries. The World Bank Group is headquartered in Washington, D.C. 10,000 employees work in more than 120 offices worldwide.

The World Bank Group consists of two development institutions, namely the International Bank for Reconstruction and Development (IBRD), focusing on middle income and creditworthy poor countries, and the International Development Association (IDA), focusing on the poorest countries. Besides them, the World Bank Group includes also and three other affiliated development institutions.

The transport sector constitutes a significant part of the World Bank's portfolio. World Bank transport projects span all transport modes and operational environments: rail, road, aviation, waterborne transport, urban transport, rural access, etc.

The World Bank's strategy in the transport sector, and companion business plan for the next three years (2016-18), aims to facilitate the movement of people, goods and ideas in developing countries by focusing on mobility solutions that provide greater access, efficiency and safety, all in a climate-friendly way.

World Bank (IBRD/IDA) transport commitments in fiscal year 2015 (FY15) amounted to US\$5.4 billion. Furthermore, in FY15, there were 197 active Bank projects with total net commitments of US\$41 billion, representing 21 percent of the Bank's total lending portfolio.

In FY15, the International Finance Corporation (member of World Bank Group) committed \$585 million in transportation and logistics, and mobilized another \$253 million from third-party investors. Overall, IFC has a \$3 billion portfolio of transportation investments covering ports, airports, railways, canals and other sectors.

Rural and inter-urban roads remain the largest sub-sector with 48 percent of lending in FY15 (US\$2.6 billion). However, the transport sector has rebalanced its portfolio with more operations in urban transport, road safety, aviation, ports, and railways, including projects that aim to improve trade competitiveness. Urban transport is a growing business for the Bank, increasing its financing share from 10 percent (\$893 million) in FY11 to 20 percent (US\$1.1 billion) in FY15.

According to the Infrastructure Strategy Update 2012 – 2015, in Asian region the World Bank Group will focus on supporting countries to ensure sustainable development of sub-national level roads to ensure good quality, all-year access and value for money in investments.

http://siteresources.worldbank.org/EXTINFRA/Resources/WB_InfraStrat_Brochure_EastAsiaPacific_2-16.pdf

II.1.17. Asian Development Bank (ADB) and Central Asia Regional Economic Cooperation (CAREC) Program

The Central Asia Regional Economic Cooperation (CAREC) Program is a partnership of 10 countries (Afghanistan, Azerbaijan, China, Kazakhstan, Kyrgyz Republic, Mongolia, Pakistan, Tajikistan, Turkmenistan and Uzbekistan) and six multilateral development partners (Asian Development Bank, European Bank for Reconstruction and Development, International Monetary Fund, Islamic Development Bank, United Nations Development Programme, and World Bank) working to promote development through cooperation, leading to accelerated economic growth and poverty reduction.

Asian Development Bank (ADB) serves as the CAREC Secretariat and takes the lead in organizing institutional events, such as ministerial conferences, senior officials' meetings, and sector and sector coordinating committees' meetings as well as liaising with partner governments and institutions.

ADB is involved in all priority sectors of CAREC—transport, trade facilitation, trade policy, and energy. Between 2001 and 2011, it has provided \$5.1 billion in loans and grants in transport, trade, and energy. It has also produced CAREC-related studies.

To guide the CAREC Program in the next 10 years, ministers of CAREC countries endorsed the CAREC 2020: A Strategic Framework for the Central Asia Regional Economic Cooperation Program 2011-2020 (CAREC 2020).

Transport is among the CAREC top priorities. The CAREC Transport and Trade Facilitation Strategy presents a shared vision of transport and trade facilitation development across the region to 2017, identifying three transport goals:

- establish competitive transport corridors across the CAREC region;
- facilitate efficient movement of people and goods across borders; and
- develop safe, people-friendly transport systems.

CAREC focuses investment and other activities on the development of six competitive transport corridors that link north, south, east, and west through the pivot of Central Asia:

- Corridor 1: Europe-East Asia;
- Corridor 2: Mediterranean-East Asia;
- Corridor 3: Russian Federation-Middle East and South Asia;
- Corridor 4: Russian Federation-East Asia;
- Corridor 5: East Asia-Middle East and South Asia;
- Corridor 6: Europe-Middle East and South Asia.

The six CAREC corridors link the region's key economic hubs to each other, and connect the landlocked CAREC countries to other Eurasian and global markets. Each corridor improves

access for CAREC countries to at least two large Eurasian markets; and the warm-water ports of Karachi and Gwadar in Pakistan open up truly global trade opportunities.

Corridors are not final products, however: once a corridor is established, it must meet the needs of its users. This means improving physical infrastructure is only part of the equation. It is also necessary to ensure border-crossing times and costs as well as other transshipment operations are completed as seamlessly as possible.

The Implementation Action Plan for the CAREC Transport and Trade Facilitation Strategy presents an aggressive investment plan to upgrade all six transport corridors to international standards by 2017.

CAREC 2020—the strategic framework for the CAREC Program, 2011–2020—lays out the next phase of priority investments in transport infrastructure along the corridors. CAREC expects additional investments over the coming decade to complete the infrastructure network and begin the process of developing the transport corridors into logistics corridors and—ultimately—economic corridors.

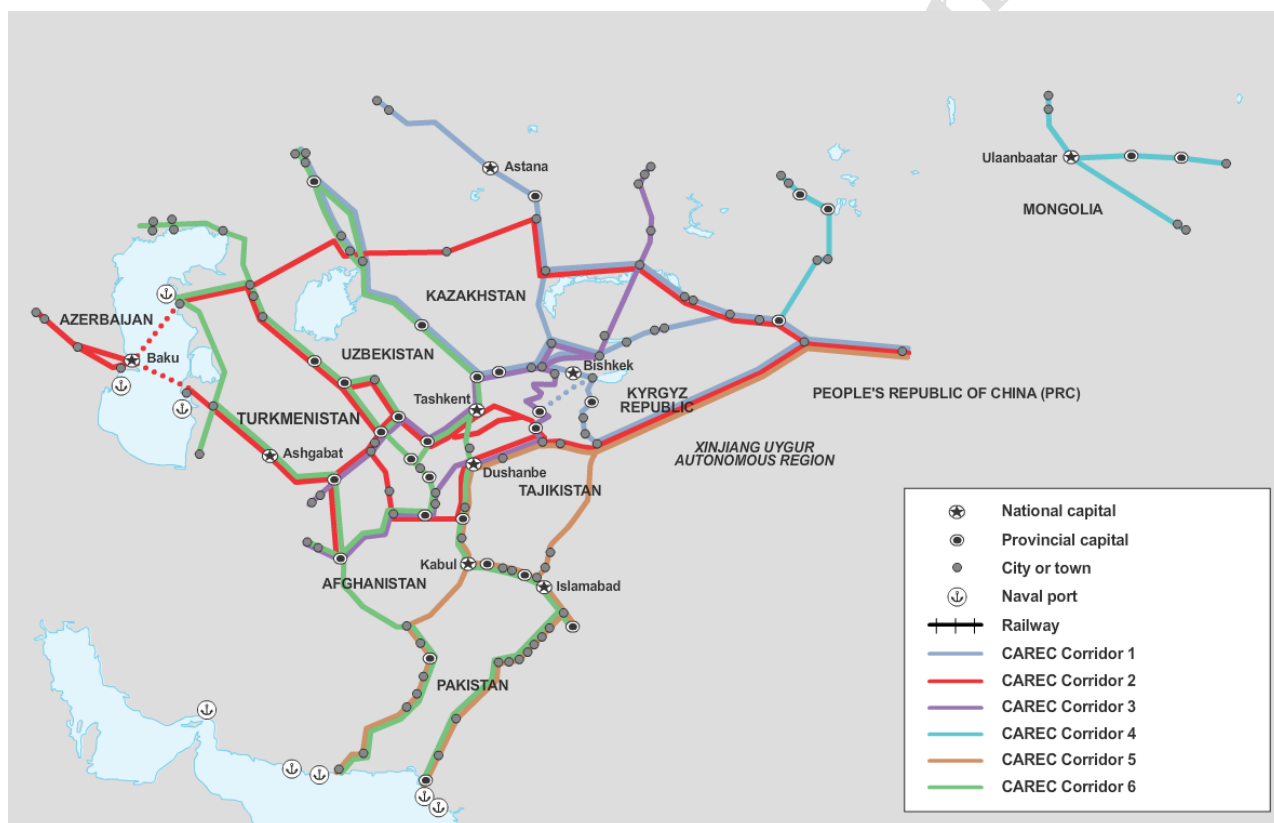

Figure *. CAREC corridors

<http://www.carecprogram.org/index.php?page=carec-program>

II.1.18. The Islamic Development Bank (IDB)

The Islamic Development Bank (IDB) is an international financial institution with headquarters in Jeddah, Saudi Arabia and regional offices in Almaty (Kazakhstan), Kuala Lumpur (Malaysia), Rabat (Morocco) and Dakar (Senegal). IDB was established in 1973 to support the economic development and social progress of its Member Countries.

In line with the strategic thrusts of the IDB, regional transport corridors continued to receive high priority in IDB's transport financing activities. In particular, IDB is financing numerous projects across the CAREC area, where the IDB had assisted the countries in construction and reconstruction of almost 1,300 km of motorways and 325 km of railways that are the part of the CAREC road corridors.

Currently (2014 – 2016) the IDB is participating in the following projects in EATL region:

- three road projects of regional importance, two in Azerbaijan and one in Kyrgyz Republic thus committing in total US\$ 471 million;
- the Alternative road corridor North-South in Kyrgyz Republic;
- road reconstruction project in Uzbekistan from Guzar to Beyneu, which is the part of Uzbek National Highway project and lies along the CAREC corridors;
- the construction of the road length Kulyab to Khalaikum in Tajikistan, which will open the new road corridor to China.

While transport corridors are developing, the IDB pays a great attention to the trade facilitation and removal of trade barriers. For this purpose the Bank via its frequent respective programs and workshops encourages its member-countries to adopt the advanced examples of international trade.

<http://www.carecprogram.org/uploads/events/2015/029-14th-CAREC-Ministerial-Conference/Key-Documents/Statements/2015-CAREC-MC-MI-Statement-IDB.pdf>

II.1.19. The European Bank for Reconstruction and Development (EBRD)

The European Bank for Reconstruction and Development was established in 1991 in London with the aim of promoting transition to market-oriented economies in the countries of Central and Eastern Europe and Central Asia. Currently the EBRD has 63 members (61 countries, the European Union and the European Investment Bank), with a total of 29 countries of operations in central and eastern Europe, Central Asia and the Caucasus - and soon in north Africa.

Considering that transport is a key enabler of growth, providing the physical networks and services upon which the economy depends for the movement of people and goods, the EBRD is striving to develop safe, secure and sustainable transport systems, which balance economic, environmental and social needs.

The EBRD priorities within the transport sector include:

- promoting market based transport. The EBRD works to improve the efficiency, market-orientation and financial sustainability of the transport sector. This includes supporting the development of the private market for transport services and increasing private sector participation in the provision of transport infrastructure through concessions;

- developing sustainable transport. The EBRD is committed to supporting the development of sustainable transport networks in the region. Climate change mitigation and adaptation, integrated network development, pollution prevention, air quality and biodiversity protection, economic inclusion and gender equality and road safety are all important sustainable transport issues which we continue to address at the policy and project level;

- broadening activity within the sector. The Bank is committed to expanding the boundaries of its activities in the transport sector to finance the needs of emerging sub-sectors. The need for freight services is growing, including road freight, and the Bank aims to promote sustainable development and reducing CO₂ emissions given the potential of logistics operations to lower energy consumption through optimized networks.

Since 1991, the EBRD has invested €14.2 billion in 280 projects in the transport sector, including 47 per cent in roads, 33 per cent in the rail network, 14 per cent in port, intermodal and logistics operations, as well as 6 per cent in the aviation sector. Among the projects, financed by EBRD, are the following:

- the railway reform in Kazakhstan. After supporting the initial restructuring of the national railways company KTZ, the Bank made several investments to help the company finance increasingly advanced efficiency measures. The Bank also participated in a bond issuance, which helped the company finance much-needed logistics infrastructure to increase cargo transit along the trade route from China to Europe;

- participation in the AIG Silk Road Fund in Azerbaijan. AIG Silk Road Fund is a private equity investment fund targeting Kazakhstan, Uzbekistan, Azerbaijan, Kyrgyzstan, Tajikistan and Turkmenistan. The project will provide equity finance to small and medium-sized private sector enterprises and joint ventures operating in the countries of Central Asia;

- East-West road corridor project in Kazakhstan;

- the Eurasia Tunnel under the Bosphorus Straits in Turkey, which was the first PPP in the country. A Turkish-Korean joint venture was selected through an international tender to build and operate the tunnel.

Draft for information only

II.1.20. Euro-Asian Development Bank (EDB)

Draft for information only

II.1.21. International Road Transport Union (IRU)

The International Road Transport Union (IRU) was founded in 1948 to represent the interests of the international road transport industry. The goals of IRU are to ensure the mobility of people and goods while improving the safety and environmental performance of road transport. The IRU holds Euro–Asian Road Transport Conferences biennially to promote and revive the “Silk Road” linking Europe and Asia.

In 2009 the New Eurasian Land Transport Initiative (NELTI) was implemented. The project aims to encourage regular roadfreight shipments between Europe and China and to assist in achieving the transit potential particularly of nations in Central Asia and the Caucasus.

The objectives of the project are to:

- contribute to the implementation of the UN Millennium Development Goals and of the Almaty Programme of Action for landlocked developing countries in order to develop Eurasian land transport links;
- assist in the development of trade in landlocked countries and regions and to broaden access for their goods to international markets;
- increase the contribution of road transport to international trade and socioeconomic development
- offer alternative delivery routes to maritime shipments to assist businesses in landlocked countries.

NELTI consists of commercial deliveries of industrial and consumer goods across the Eurasian landmass, performed by independent transport companies from Eurasian countries along five different routes (see fig. **).

Figure *. NELTI routes

NELTI is developed in consequent phases.

In the course of Phase I of the project a series of successful demonstration road transport caravans was undertaken in 2002-2007 (Lisbon-Vladivostok, Beijing-Brussels, and Black Sea Ring Caravan). One of the objectives, along with solution of commercial and political tasks, was also building up and adjusting mechanisms of logistic support and stimulating haulage, in the longer run, of Chinese freights by road transport routes along the historic Great Silk Road.

Within the framework of Phase Two of NELTI (2009-2011), the development of the system of regular road transport haulage between Asian and European countries was continued, with China involved in this system. Certain measures were enforced in accordance with the provisions of Memorandums of Understanding and regional agreements aimed to further the development of Euro-Asian transport communications, remove the barriers therein, simplify the border crossing procedures, harmonize the legal provisions in the transit countries, etc.

NELTI-3 was launched in June 2011 to identify the main impediments and non-physical barriers to international road transport within the Economic Cooperation Organization (ECO) region and help governments implement the appropriate UN multilateral instruments to stimulate economic growth by facilitating trade and international road transport.

In September 2012 IRU had launched NELTI-4 in cooperation with Arab Union of Land Transport (AULT) in the Arab world.

One of the most important aspects of the NELTI project during all its phases is monitoring. Monitored data collected *en route* by NELTI drivers - applying internationally recognized UNESCAP methodology for data collection - on road conditions, waiting times at border-crossing points, quality of road infrastructure, administrative barriers etc., are subsequently analyzed by the Dutch Transport Research Institute (NEA) to develop road maps identifying the issues to be solved and the measures required to reduce the time and cost of road transport haulage between China and Europe.

NELTI monitoring has unveiled a high competitive potential for the development of the NELTI northern, central and southern routes. However, the data has also highlighted that 40 % of road transport time along the routes of the Silk Road is lost at borders due to inappropriate border crossing procedures which impede trade growth along the entire Eurasian landmass. In addition, approximately 30% of the transport costs were due to unofficial payments, borne by the hauliers en route and at border crossing points.

II.1.22. International Union of Railways (UIC)

UIC is the worldwide professional association representing the railway sector and promoting rail transport. To enable UIC to effectively fulfil its mission, 3 levels have been defined for international cooperation activities:

- **strategic level:** coordination with and between the 6 UIC Regions (represented by UIC Regional Assemblies for Africa, Asia, North America, South America, Europe and Middle-East);

- **technical/professional** cooperation level structured around the following railway activities: Passenger, Freight, Rail System – including infrastructure, rolling stock, operations – and Fundamental Values including cross-sector activities such as Sustainable Development, Research Coordination, Safety, Security, Expertise Development). Strategic priorities for technical cooperation activities are set out by forums and platforms composed of member representatives;

- **support services level:** Finance, Human Resources, Legal, Communications and Institutional Relations.

UIC promotes intercontinental and transcontinental rail traffic and has a dedicated group of experts dealing with this issue - the Global Team of Experts (GTE) Members of the group represent rail and non-rail key stakeholders (railway undertakings, freight forwarders, rail associations, potential customers, shipping lines and others). The GTE serves as a platform for exchange among all stakeholders, and to initiate and steer projects creating the right framework conditions for developing long-distance rail traffic.

Following the results of the study ICOMOD (project aimed at establishing the viability of a rail link between Europe and Asia and at assessing the market size) and in the light of the strengthening cooperation between UIC and other International Associations, the year 2012 was aimed at repositioning the UIC group. A gap analysis identified the need to continue market oriented research activities. The GTE activities are now focused on the following issues:

- analyzing and generalizing information on technical compatibility and interoperability within ITCs;

- summarizing the results of activities among international organizations and certain railway operators aimed at improving transportation along ITCs;

- forecasting of freight and passenger transportation volumes, establishing a data base of freight points of origin and destination as well as volumes structure;

- developing a marketing approach to improve the appeal of ITCs for freight owners and forwarders, presenting the opportunities and prospects offered by ITCs at international forums.

<http://www.uic.org/corridors#documents>

Trans-Caspian International Transport Route (TITR)

As a part of the “New Silk Road” intermodal East-West transport infrastructure initiative, Azerbaijan, Kazakhstan, Georgia and Turkey agreed on creation of the Trans-Caspian International Transport Route (TITR).

In the framework of the TITR project, a cargo train that launches from China will be able to reach Europe in less than 14 days, which is the most competitive route in terms of transport time. For instance, it takes around 15-19 days for a cargo train that departs from China and passes through the Russian territories to reach Europe, and it takes more than a month for a cargo from the Eastern China to arrive in Europe using the current maritime route. Therefore, the TITR would have obvious advantages over the existing inland and maritime routes.

The agreement on the establishment of the Coordination Committee to develop the Trans-Caspian International Transport Route was signed by the representatives of the national railway companies from Azerbaijan, Kazakhstan and Georgia, and the representatives of the ports of Aktau and Baku during the 2nd International Transport and Logistics Business Forum “New Silk Road” in November 2013. During the 5th meeting of the Coordination Committee on the development of the TITR on October 20, 2014 participants of the TITR project agreed to accept the Turkish State Railways to the Coordinating Committee.

Currently, the regular meetings of the working group of the Coordination Committee are attended by the heads of the JSC “NC Kazakhstan Temir Zholy”, the Turkish State Railways, the JSC “Azerbaijan Railways”, the JSC “Georgian Railways”, the JSC “NC Aktau International Sea Trade Port”, the Baku International Sea Trade Port, the JSC “Azerbaijan Caspian Shipping Company” and the LLC “Batumi Sea Port”.

The most significant result of the TITR working group meeting was reached in Batumi on July 24, 2015, namely, in coordination with the Chinese transport company, Minsheng Logistics. The parties managed to launch the first container train over the Trans-Caspian International Transport Route. On July 28, 2015, the test cargo train departed from the Xinjiang province in China, travelled along the Shihezi-Dostyk-Aktau-Alyat-Keshla route through the territories of Kazakhstan and Azerbaijan, and arrived at the Baku International Trade Port complex, located in the town of Alyat (around 30 miles south west of Baku).

The train carried caustic soda and consisted of 41 platforms and 82 containers, weighing 20 tons each. It traveled for 6 days and for more than 4,000 kilometers, passing through the Kazakh port of Aktau. Therefore, it was the first successful attempt to launch a cargo train from China to the Caspian region through the Caspian Sea.

The test train showed the principle capability of the parties to reach an agreement on tariff policy and on harmonized customs procedures providing a competitive route from Asia to Europe.

The second container train via the Trans-Caspian International Transport Route arrived in Georgia on October 3, 2015. The train, consisting of 44 containers, departed from the Chinese Xinjiang province, travelled on the Alashankou-Dostyk-Aktau-Alyat-Tbilisi route and arrived in Georgia in eight days. The second test train showed that the organization of the container service on the China-Kazakhstan-Azerbaijan-Georgia-Turkey route could really meet the expectations of the TITR members.

It is expected that approximately 300,000-400,000 containers will be transported via the Trans-Caspian International Transport Route by 2020 ensuring an average speed of up to 1,100 km a day. Participants predict that the TITR will initially be able to transport up to 5.5 million tons of cargo annually, increasing to 13.5 million tons per year by 2020.

During the meeting in Baku in January 2015, the Coordination Committee reached an agreement on the adoption of measures for utilizing the new Zhezkazgan - Beineurailway lines and on the capacity of Kazakhstan's Aktau and Azerbaijan's Baku seaports in order to create favorable tariff conditions.

Despite the agreements, there remains one important missing part of the TITR, namely, the 826-kilometer Baku-Tbilisi-Kars (BTK) railway connection. Opening of the BTK railway with an annual carrying capacity of 6.5 million tons by the end of the year with further integration with the "Marmaray" rail project under the Bosphorus Strait will allow freight trains to travel between Europe and Asia along the fully launched Trans-Caspian International Transport Route.

However, even if all parts of the TITR corridor are linked together, there will still be a necessity to increase the transit capacity of the existing infrastructural facilities. For instance, the "Kazakhstan Temir Zholy" transport company is about to finish the expansion works in the Aktau port, which will allow to put in operation anew grain terminal with a capacity of 1.5 million tons and two additional dry-cargo terminals with a total capacity of 1.5 million tons. Moreover, two universal ferries will be purchased within the framework of implementation of the new state program. Herewith, the port capacity will increase from 16.8 million tons to 21 million tons per year. In addition, Azerbaijan is also upgrading its maritime infrastructure. In accordance with the plans for modernization of the Caspian Sea infrastructure, Azerbaijani officials made a decision to launch a new port complex in Alyat as part of the Baku seaport. The first ferry terminal in Alyat with transshipment volume of 10 million tons of cargo per year was opened in 2014. At the final stage of the construction works, the Alyat port complex is expected to have an annual transport capacity of up to 25 million tons. In conclusion, it should be noted that the sharp drop in oil prices has increased the significance of benefits of freight transportation, especially for countries such as Kazakhstan and Azerbaijan. Therefore, establishing the Trans-Caspian International Corridor should be considered as a mutually beneficial project, which could potentially pave the way to build new multimodal transportation hubs in Eurasia.

Source: Eurasian Research Institute Weekly e-bulletin 06.10.2015-12.10.2015 • No: 36/
DEVELOPMENT OF THE TRANS-CASPIAN INTERNATIONAL TRANSPORT ROUTE.

II.1.23. Global Partnership for Sustainable Transport (GPST)

Draft for information only

II.2. Most important national level programmes and projects

Azerbaijan Republic

In 2015, the Azerbaijani Railways carried 17.09 million tons of goods, including 13 million tons carried as international operations⁷. Special attention is paid to the modernisation of the railway infrastructure in section Bejuk-Kjasik –Ganja. Baku – Sumgait section was reconstructed.

In 2015, two container block trains China – Kazakhstan – Azerbaijan – Georgia and China – Kazakhstan – Russia –Azerbaijan – Georgia were put into service.

2838 new freight wagons, 4 new electric multiple units and 8 new diesel locomotives were purchased.

Republic of Belarus

In 2015, the volume of cargo transportation on the Belarus Railway made up 131.4 million tons of goods⁸. The number of regular container block trains running between China and West Europe has been steadily grown. In 2015 8 trains run between Belarus and Germany, Poland, Czech Republic and Lithuania.

Due to the improvement of train handling procedures, the time of cargo trains stops at the Brest border crossing point reduced from 36 to 10 hours with transshipment and to 6 hours without transshipment.

The Belarus Railways are completely opened for transportation of freight in all directions using the CIM/SMGS consignment note. During 2015 more than 29 thousands TEUs run under such a consignment note.

In 2015, as part of development of the railway infrastructure, the projects: “Extension of the receiving-departure lines of Orsha-Centralnaya railway station and Sitnitsa railway station” and “Development of the second stage of the Project “Electrification of the 86 km of Gomel – Zhlobin section” were successfully completed. In 2015, 279 new freight wagons were purchased.

⁷ Report on the activities of the Organisation for Cooperation between Railways (OSJD) in 2015. Warsaw, 2016

⁸ Report on the activities of the Organisation for Cooperation between Railways (OSJD) in 2015. Warsaw, 2016

Bulgaria

In 2015, *the Bulgarian Railways* continued reconstruction and modernisation of OSJD Railway Corridor No. 6, and modernised Septemvri – Plovdiv and Plovdiv – Burgas sections. Now, Plovdiv intermodal terminal is under construction.

In 2015, the National Railway Infrastructure Company (NRIC) entered the TIS (the Train Information System) of the International Organisation of Rail Infrastructure Managers on a permanent basis; that enables Bulgarian and foreign operators to monitor their international trains in real-time. Besides, the train information system makes it possible to monitor train delays at the border crossing points and causes thereof.

China

In 2015, *the Chinese Railways* carried 2.71 billion tons of cargo and 2.53 billion passengers.

9531 km of new railway lines were put in operation, of which 3306 km are high-speed ones.

The Chinese Railways have introduced the principle of independent administrative and economic functions. In order to promote the innovative structural systems and acceleration of the railway construction, measures were developed aimed at:

- further transformation of the governmental functions;
- facilitation of the administrative procedures;
- consolidation of the railway transport control and management;
- promotion of railway tariff reform;
- coordination of further railway transport development.

Kyrgyz Republic

The Kyrgyz Railway has modernized above 150 km of railway lines of the northern and southern sections with the laying of new reinforced concrete and timber sleepers for 2011-2015 years. Six new modern Evolution fifth generation diesel locomotives TE33A were put in service. Two car-repair plants were established for the purpose of modernisation and repairs of freight wagons and passenger coaches that allows extending the life of wagons.

Fibre-optic communication line is laid at Lugovaya – Bishkek – Rybachye section.

The strategic projects of construction North – South trunk railways are being successfully implemented as part of the Russia –Kazakhstan – Kyrgyzstan – Tajikistan project and China – Kyrgyzstan project.

Latvia

In 2015, the Latvian Railway carried 55.6 million tons of goods, of which 53.9 million tons – internationally.

The new Bolderāja-2 – Krievu railway line was put in service, with the construction of new Bolderāja -2 railway station.

In 2015, 47.2 km of railway lines were modernized and 93.8 km were reconstructed. The second 56 km track at Skrīveri – Krustpils section was opened.

Lithuania

In 2015, the Lithuanian Railways carried 48.1 million tons of goods.

1,435 mm gauge railway line of 115.2 km from the state border with Poland to Kaunas railway station was put in service as a result of implementation of the project “Rail Baltic”.

The projects of modernisation of the railway infrastructure of OSJD corridor No. 9 (Kena – Vilnius – Siauliai – Klaipeda), construction of the second track on Kyviskes – Valciunai section, as well as on Pavenciai – Raudėnui, Telšiai – Dusaikai and Kūlpėnai – Kretinga sections were successfully completed.

As a result of modernisation of 1,520 mm gauge infrastructure, 53.7 km of new lines and 4 bridges have been constructed and 44.1 km of the existing tracks have been reconstructed.

A computer-based system of commercial inspection of trains and wagons was installed at Kena and Kibartai border stations, as a result of which the duration of commercial inspection of trains was significantly reduced and made more exact, with the recording of all cases of incorrect loading and load securing, technical and commercial condition of wagons and coaches and cargo shortage in case theft.

Republic of Moldova

In 2015, the Moldova Railway spent more than 1.5 million US Dollars for rehabilitation project and entered into a loan agreement with the European Bank for purchase of 10 new main-line locomotives, modernisation of locomotive depots, and recovery of the railway infrastructure for 100 million Euros in aggregate.

The Railway of Moldova State Enterprise and the State Administration for Railway Transport of Ukraine signed an Agreement for electronic data exchange in the international freight transport. A significant progress is availability of all types of control (border control, customs check,

sanitary inspection, veterinary inspection, etc.) on the principle of “the single window” at all railway border stations of Moldova.

Approximately 25 thousands consignments were carried over the territory of the Republic of Moldova using the CIM/SMGS consignment note in 2015.

Mongolia

In 2015, the volume of freight transit through the Ulan-Bator Railway increased by 101.38%. Two new container lines Chengdu (PRC) – UBZD – RZD – Łódź (Poland), Zhengzhou (PRC) – UBZD – RZD – Duisburg (Germany) were opened.

A new 24.5 km railway line for iron ore transportation was put in operation. Three new remote control crossing loops were constructed and put into operation.

Annex No. 9 to the International Convention on Harmonisation of Frontier Controls of Goods is successfully implemented, that is witnessed by reduction by 45 minutes of the time of border control of freight trains between Russia and Mongolia.

Fig. ** Transit rail corridors in Mongolia

Time of railway transit via territory of Mongolia (fig **):

- Corridor Sukhbaatar – Zamiin-Uud **30 hours**;
- Corridor Zamiin-Uud - Sukhbaatar **36 hours**.

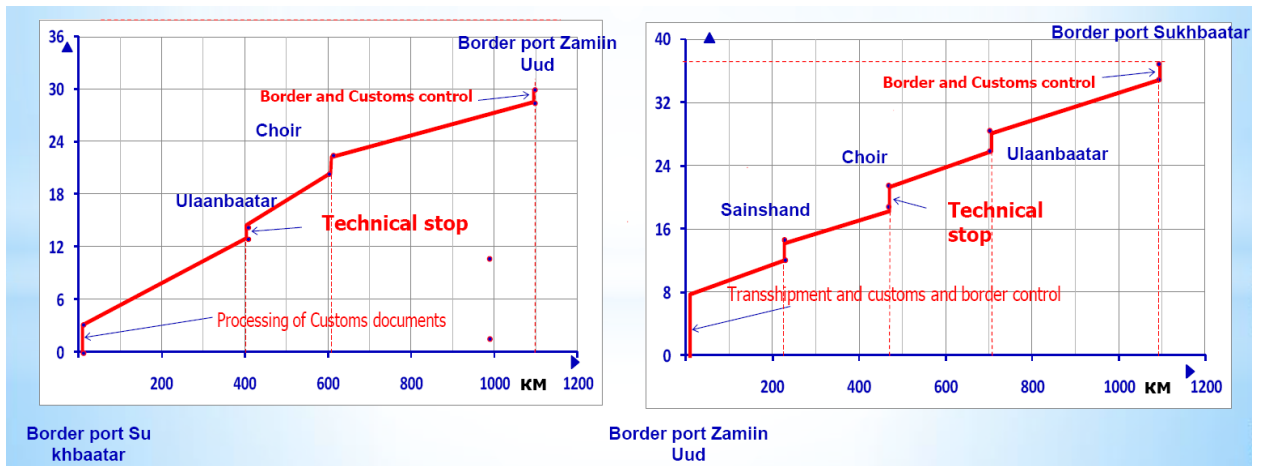

Fig **. Time of railway transit via territory of Mongolia, hours

Poland

In 2015, the Polish Railways (PKP Cargo JSC) carried 117.59 million tons of goods, including 48.26 million tons on international routes. Over 800 km of railway lines were modernised due to which the train en route time in Trójmiasto – Wrocław, Poznan – Krakow, Warsaw – Bielsko-Biala, Olsztyn – Bydgoszcz sections significantly reduced.

The PKP Cargo JSC has been effectively developed the container terminals at Poznan-Franovo station in Poland (owned by PKP Cargo), as well as in Czech Ostrava- Paskov (a terminal owned by Advanced World Transport, an affiliate of PKP Cargo Group).

The PKP Cargo JSC actively participates in the stimulation of the railway traffic from China to West and South Europe as part of the New Silk Road (to more than 10 trips weekly).

The PKP Cargo JSC has purchased 15 Siemens Vectron multisystem freight locomotives for service on the trans-border lines. For the purposes of strengthening of the cargo protection, security improvement and train monitoring, unmanned aerial vehicles are now used, as a result of which losses have been reduced almost by 60%.

Russian Federation

The cargo turnover of the Russian Railways JSC made up 2.302.738 million tons (100.3%), of which 1.304.478 million tons (100.7% to 2014) – on the international routes. 25 new container train lines: Duisburg – Korla, Värtsilä –Korla, Sergeli – Nakhodka, Hefei – Hamburg, Nakhodka-Vostochnaya – Khovrino, Koity – Novorossiysk, etc., were put into operation.

In 2015, 3.4 km of new railway lines were put into operation. Reconstruction of Babaevo station of the Oktyabrskaya Railway and construction of new Chernyshevskoye border station of the Kaliningradskaya Railway were successfully completed.

Technical upgrading of Petushki – Nizhni Novgorod section of the Gorkovskaya Railway was in progress. Tonnelnaya station of the Northern Caucasian Railway, Cherepovets-II station of the Northern Railway, Volkhovstroy-I station of the Oktyabrskaya Railway, Kinel stations of the Kuybyshevskaya Railway, Ekaterinburg-Sortirovochnaya station of the Sverdlovskaya Railway are under reconstruction.

500 new locomotives and 240 rolling stock units were purchased.

The development of market relations and competition in the freight wagon operations encouraged investments in the construction and modernisation of the carriage rolling stock: private investments of over 10 billion US Dollars were attracted, as a result of which the freight car fleet was significantly renovated and the total number of wagons reached 1 million 124 thousand units.

Republic of Tajikistan

The Rohi Ohani Tojikiston State Unitary Enterprise (Tajik Railway) carried 6.1 million tons of goods in 2015.

The construction of the new Vahdat – Yavan railway is in progress; the railway lines at Rahaty – Vahdat – Elok and Kurgantube – Yavan sections are being modernized; the construction of 40.7 km Vahdat – Yavan section is expected to be completed in 2016, on the occasion of the 25th anniversary of independence of Tajikistan.

Romania

In 2015, the Romanian Railways carried 23.821 million tons of goods (103% to the previous year level). CFR-Marfa – Romanian Freight Operator - carried 19922 operations with the unified CIM/SMGS consignment note.

The railway lines Cămpina – Predeal, Bucharest – Braşov, Curtici – Simeria, Braşov – Simeria were actively modernized to cause train running at the maximum speed of 160 km/h.

16 railway stations: Giurgiu, Slatina, Bistriţa Nord, Botoşani, Vaslui and other, have been modernised.

Republic of Uzbekistan

In 2015, the freight traffic on the Uzbek Railways made 81.8 million tons.

The first stage of electrification of 140.8 km Marakand – Karshi railway section was successfully completed. 55 locomotives and 1258 freight wagons were successfully modernised, 11 new freight electric locomotives, 650 freight wagons were delivered.

Ukraine

The Ukrainian Railway was effectively involved in the establishment of new container train lines: European countries – Ukraine (Chop), Batevo/Izov – Ilyichyevsk-Paromnaya – Georgia (Poti/ Batumi – Gardabani) – Azerbaijan – (Bejuk- Kjasik – Alyat) – Kazakhstan (Aktau-Port – Dostyk) – China through ferry crossing Ilyichyevsk – Poti/Batumi and Alyat – Aktau – Aktau-Port.

Operation on the border stations and checkpoints is now based on the principle of the “single window”, when all public control services are accessible.

The transport infrastructure of the international transport was actively developed, the amount of works totaled to 650.47 million grivnas.

In 2015, 76128 carriage operations were made under the unified CIM/SMGS consignment note that is by 10% more than in 2014.

II.3. Container block-trains in the EATL trade-

II.3.1. Block trains role in the Euro-Asian logistics

In 2015, The railways of the following countries: Belarus, Bulgaria, Latvia, Lithuania, Kazakhstan, China, Mongolia, Poland, Russia, Uzbekistan, Ukraine and other countries successfully continued to create new, container routes, thus having increased the number of container block trains running on the railways of OSJD member countries up to 280, of which 100 run on the regular basis.

Within the framework of OSJD activity on “Organisation of large-scale container traffic between Europe and Asia” the following works have been performed:

In 2015 815 container block trains were organised in the direction of China – Europe – China, of which from China to the countries of Europe - 550 trains, and 265 trains back (according to the information of the Chinese Railways).

For the past few years the number of regular freight trains running between China and Western Europe has been steadily growing, as more and more wide range of consignors begins to perceive railways as a real alternative to the sea and air traffic.

Nowadays eight container trains have been running in the traffic China – Western Europe – China through the Byelorussian Railway in the direction of Germany, Poland, Czech Republic and Lithuania along the following routes:

- China – Poland (Chengdu – Lodz);
- China – Germany (Zhengzhou – Hamburg);
- “New Silk Way” China – Germany (Chongqing – Duisburg);
- “BMW” Germany – China (Leipzig – Shenyang);
- “Ford” Germany – China (Duisburg – Chongqing);
- China – Germany (Wuhan – Hamburg);
- China – Spain (Yiwu – Madrid).

The running frequency of container trains from China to Europe has already reached 4 times a week, and once a week – in backward direction.

Travel time of container block trains through the Byelorussian Railway from the station Krasnoje (state border with Russia) to Brest is less than 12 hours, with an average speed, respectively, of 1400 km/day and with the minimum waiting time at stations.

Following the results of work for 2015 positive dynamics of container traffic growth between China – Europe – China have been reached of up to 28.6 thousand containers in TEU (growth by 1.9 times from 2014).

In 2015 1269 container trains proceeded through the network of the Railway of Kazakhstan in the transit traffic; the number of container trains increased by 255 trains as compared to 2014 (growth by 25%), incl. 581 trains China – Europe – China - grown by 327 trains (or by 2.2 times).

Container trains have proceeded in transit through Kazakhstan along the following main routes:

- Chengdu (China) – Lodz (Poland) - 61 trains (+16 trains against 2014, have been running since 19 December 2012);
- Zhengzhou (China) – Hamburg (Germany) - 49 trains (-22 trains against 2014, have been running since 17 July 2013);
- Chongqing (China) – Duisburg (Germany) - 146 trains (+55 trains against 2014, have been running since 19 March 2011);
- Wuhan (China) – Pardubice (Czech Republic) - 23 trains (+7 trains against 2014, have been running since 5 June 2014);
- Wuhan (China) – Hamburg (Germany) - 62 trains (+61 trains against 2014, have been running since December 2014);
- Yiwu (China) – Madrid (Spain) - 17 trains (+16 trains against 2014, have been running since 8 December 2014);
- Hefei (China) – Hamburg (Germany) - 3 trains (a new route);
- Lanzhou (China) – Hamburg (Germany) - 1 train (a new route);
- Putyan (China) – Terespol (Poland) - 1 train (a new route);
- Duisburg (Germany) – Chongqing (China) - 118 trains (+99 trains against 2014, have been running since March 2013);
- Hamburg (Germany) – Zhengzhou (China) - 32 trains (+24 trains against 2014, have been running since September 2014);
- Hamburg (Germany) – Wuhan (China) - 15 trains (+15 trains against 2014, have been running since December, 2014);
- Lodz (Poland) – Chensyan (China) - 26 trains (a new route);
- Madrid (Spain) – Yiwu (China) - 2 trains (+2 trains against 2014, was organised in December 2014);
- Kotka (Finland) in the direction of China - 7 trains (a new route);
- Hamburg (Germany) – Lanzhou (China) - 32 trains (a new route).

Besides, on 28 July 2015 the first demonstration container train “Nomad Express” was launched through the Trans-Caspian international transport route with participation of railway and sea transport/ferry operators along the route of Shikhezi (China) – Dostyk (Kazakhstan) – Aktau Port (Kazakhstan) – Kishly (Azerbaijan).

On 29 November 2015 the second container train “Nomad Express” set off along the route Lianyungang (China) – Dostyk – Aktau-Port (Kazakhstan) – Baku (Port Alyat) (Azerbaijan) – Uzlovaya/Poti (Georgia) – Istanbul (Turkey) including the section of Poti – Istanbul with the delivery by road.

According to the Lithuanian Railways JSC (LG) a Hoptrans Italy Express container train was organized in April 2015 in the direction of Lithuania – Poland – Czech Republic – Austria – Italy. The Hoptrans Italy Express container train represents the first innovative logistic project connecting the Baltic Sea region to the southern part of Europe (Italy). The project has been implemented by the Hoptrans Projects CJSC in cooperation with Italian and Polish partners. In April 2015 along the route of Sestokai (Lithuania) – Piadena (Italy) – Sestokai (Lithuania) two container trains were launched. Duration of containers delivery has averaged 12 days. The container train has transported 72 loaded containers of 45 feet long. The planned frequency of train running is two times a month, further on – once a week.

Since the end of 2014 and till April 2015 the Ulan-Bator Railway JSC (UBZD JSC) together with the railways of the People’s Republic of China, Russia, Belarus, Poland and Germany has organised successfully the runs of 18 transit container trains through the territory of Mongolia in the traffic Asia – Europe – Asia in the following directions:

- from Germany to China along the route of Hamburg – Brest – Naushki – Ulan Bator – Zamyn-Uud – Erlian – Zhengzhou (3 trains);
- from China to Poland along the route of Chengdu – Erlian – Zamyn-Uud – Sukhe-Bator – Naushki – Brest – Lodz (6 trains);
- from China to Germany along the route Zhengzhou – Erlian – Zamyn-Uud – Sukhe-Bator – Naushki – Brest –Hamburg (9 trains).

At present negotiations are underway aimed at increasing the number of container trains running both in transit, and in other relations.

According to the Ukrainian Railway PJSC transportation of containers as a part of container trains has constituted 27% of the total amount of containers carried through the territory of Ukraine.

For all container trains technical and technological conditions of their operation have been worked out, as well as reduced tariffs for the transportation of goods by the specified trains have been established.

To attract sufficient volumes of container cargoes to be transported by the “Viking” and “Zubr” trains the project participants (railway administrations of Ukraine, Belarus, Lithuania, Latvia, Estonia, Moldova, Romania and Bulgaria) have prolonged tariff rates for 2015 which were in effect throughout 2014.

The train schedule for the “Viking” and “Zubr” trains for 2015/2016 has been worked out according to the time provided for in it the train can run on the daily basis. Frequency of their running has been also established: three times a week for departing of the train from the Black Sea region.

In order to improve the train organisation of the “Viking” combined transport and to expand the geography of its operation a few new participants have joined the project in May 2014: National

Society of Railway Cargo Transportation of Romania “CFR Marfa”, and in March 2015 – Georgian Railway JSC.

Container train traffic has been also organised along the route Romania (Dornești) – Ukraine (Vadul Siret – Zernovo) – Russia (Tolyatti) for the transportation of car accessories and spare parts.

Container train has been successfully performed along the route Slovakia (Kosice) – Ukraine (Uzhgorod – Zernovo) – Russia (Perspektivnaya). Car and vehicle accessories are transported by this train.

Along with the trains running in the specified routes, traffic has been organised with large containers to cut the time of goods delivery which arrive into the territory of Ukraine through the Black-Sea ports. Flexible policy is pursued in regard to the departure of the trains: they are sorted and depart upon the arrival of containers in ports.

Moreover, since 2015 Ukrzaliznytsia PJSC have been working towards organising container train traffic along the following route: countries of Europe – Ilyichyevsk-ferry (Ukraine) – Batumi (Georgia) – Bejuk-Kjasik – Buck (Azerbaijan) – Aktau-Port – Dostyk (Kazakhstan) – China through the ferry crossings Ilyichyevsk – Batumi and Alyat – Aktau-Port. Use of this transport route’s potential will make it possible to attract additional volumes of container traffic between EU Member States and the countries of Caucasus region, Central Asia and China.

According to the Azerbaijani Railways CJSC, dynamic wagon weighbridges have been installed at the border stations of Bejuk-Kjasik and Yalama by the customs authorities, and X-ray wagon inspection equipment has been installed at Yalama station by the border guard.

Table N1. – List of container trains and contrailer traffic on the railways of OSJD Member Countries (as of 16.10.2015)⁹

No. of Train	Route	Train Characteristics	Run Frequency
Byelorussian Railway (BC)			
1022/1021	Russia – Lithuania – Belarus – Russia (Kaliningrad – Kybartai – Gudogaj – Krassnoje – Kunzevo-2 / Moscow-Tov.-Smolenskaja / Kupavna)	Container	on request
1025/1026	China – Russia – Belarus (Zabaikalsk – Krassnoje – Brest)	Container	on request
1027/1028	Russia – Belarus (Nakhodka / Nakhodka-Wost. – Krassnoje – Brest)	Container	on request
1037/1038	China – Russia – Belarus – European Countries (Zabaikalsk – Krassnoje – Brest – Malaszewicze)	Container	on request
1039/1040	Russia – Belarus – European Countries (Zabaikalsk / Vladivostok / Nakhodka-Wost. – Krassnoje – Brest – Malaszewicze)	Container	on request
1062/1061	European Countries – Belarus – Russia (Bruzgi – Krassnoje – Nowojerusalimskaja)	Container	on request
1064/1063	France – Poland – Belarus – Russia (Malaszewicze – Brest – Krassnoje – Vorotinsk)	Container	on request
1066/1065 “East Wind”	Germany – Poland – Belarus – Russia (Malaszewicze – Brest – Krassnoje – / Kunzevo-2)	Container	on request
1068/1067	Germany – Poland – Belarus – Russia (Malaszewicze – Brest – Krassnoje – Moscow-Tov. /	Container	on request

III. MAIN OBSTACLES HAMPERING THE EURO-ASIAN TRANSPORT LINKAGES DEVELOPMENT

III.1. General overview

During the Phase I of the project the main Euro-Asian road, rail and inland water transport routes, transshipment points and ports were selected. Projects had been prioritized in order to focus on improvement the certain routes.

311 projects proposed by the participating countries have been evaluated during Phase II of the EATL project from the standpoint of their value to connect Asia and Europe. The assessment of appropriate investment needs was undertaken which formed the basis of the updated EATL Investment Plan.

An enormous work had been done by the governments of EATL countries to implement these decisions and plans. As a result, the current infrastructure seems to generally support the existing transportation flows, whereas the remaining missing links and the upgrade of existing infrastructure is in the focal point of the national transport strategies and the international programs.

At the same time, the existence of high-level transport infrastructure – railways, roads, inland waterways - is a necessary, but not a sufficient condition for efficient and competitive transport routes serving the trade lanes.

Numerous obstacles and bottlenecks along transport routes occur disrupting the traffic and goods flows. These obstacles can be divided into two groups: physical and non-physical barriers.

Physical barriers occur due to of natural reasons, technical and technological inconsistency, poor infrastructure maintenance, shortage of network sections/nodes capacity. A special type of physical barrier is the absence of particular section of transport network or certain object (bridge, intermodal terminal, logistic center, etc.) that could obviously improve the conditions for transportation and trade.

Non-physical barriers represent lack of proper policies, not harmonized legislation, poor regulations and administrative procedures, lack of cross-border administrative interoperability, non-application of trade facilitation standards and best practices, insufficient attention to modern IT equipment for processing and data exchange unskilled personnel. Besides that, one can not skip such issues like contradictions of state and private interests and, in some cases, corruption. Non-physical barriers can cause enormous losses of time and money decreasing the quality of service or even creating the serious barriers on particular trade lanes.

During the general economic crisis and the shortage of infrastructure funding the attention to non-physical obstacles should be, probably, higher than ever. Research results demonstrate that very often investments aimed to construct or rehabilitate infrastructure objects are way less effective than efforts focused on procedures improvement. For example, ...**Пример эффективности устранения нефизических барьеров?

In Europe, in EU – in particular, enormous efforts have been undertaken for decades to eliminate such barriers. This work was guided and financed within the general context of creating the common economic space. Smooth transportation had been developed to provide smooth trade

and smooth distribution; the whole economic and business environment is been improved under the “integrity” slogan.

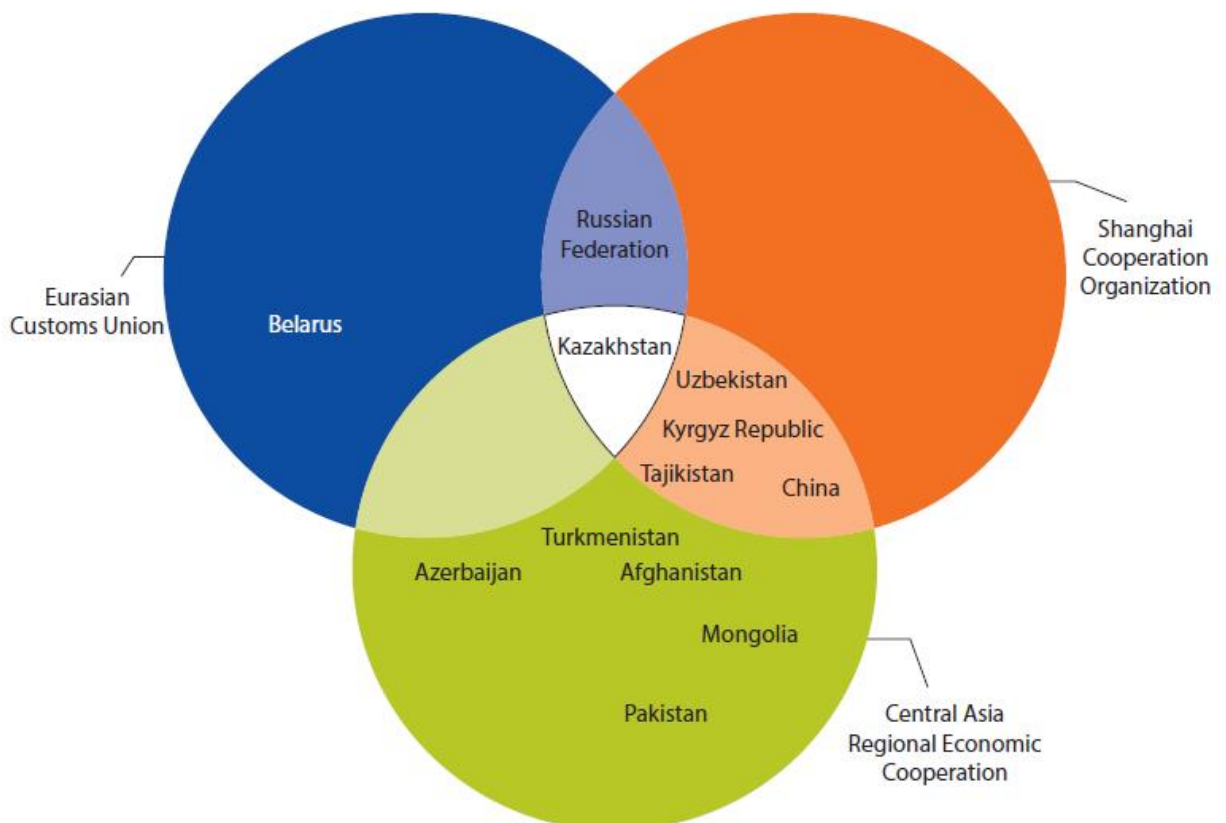

The situation in the Central Asia is different.

The challenge of re-creating a trade and transportation environment for countries of Central Asia - and more generally, the former Soviet Union republics - have been taken seriously for two decades by various institutions. Visible trends for integration and harmonization are developing in the Central Asia region. Some countries had joined the WTO; certain states have the observer status in this organization. Eurasian Economic Union and the Customs Union creation - as well as the numerous bilateral agreements - is the important step towards the free trade relationships (see p.*).

At the same time, the problem is that this area does not have one single integration idea as a general “umbrella” for regional plans, programs and projects. There is a so-called “spaghetti bowl” situation where numerous initiatives overlap with inconsistent country membership (figure *). Three main groups of initiatives can be shown to improve connectivity (Linn 2012): (1) corridor-based initiatives such as the Central Asia Regional Economic Cooperation (CAREC), (2) the Shanghai Cooperation Organization (SCO) supported by China, and (3) the Eurasian Customs Union, led by Russia.

It will obviously take time to reach the goals set by numerous initiatives. Currently the key word for the Central Asian region in sense of trade lanes is “fragmentation”.

Transport communications as well as the trade lanes are still influenced by historical “heritage”. Transit operates over long distances and generally involves many transport providers representing different economic systems. Border crossings disrupt the traffic and commodity flows. The supply chain design implies numerous difficulties such as obligatory customs brokers’ services or mandatory going through a bonded warehouse or compulsory conveying of traffic. For these reasons, supply chains in the EATL region are especially fragmented and vulnerable.

Note: AFG = Afghanistan; AZE = Azerbaijan; BLR = Belarus; CAREC = Central Asia Regional Economic Cooperation; CHN = China; KAZ = Kazakhstan; KGZ = Kyrgyz Republic; MNG = Mongolia; PAK = Pakistan; RUS = Russian Federation; SCO = Shanghai Cooperation

Figure **. The “Spaghetti Bowl” of Regional Organizations in Central Asia (Lynn 2012, World Bank)

Figure * illustrates the example of imports of goods to Kazakhstan. According to Rastogi et al (2014), this logistic scheme includes three phases:

- international transit from the Russian Federation or China into Kazakhstan by truck or rail (rail wagons or containers), with intervention of transport companies, brokers, and forwarders;
- clearance and warehousing in one of the main cities in Kazakhstan, with intervention of brokers and border agencies, and third-party logistics providers(3PLs) and
- distribution logistics in Kazakhstan or Central Asia, with interventions of local transport companies.

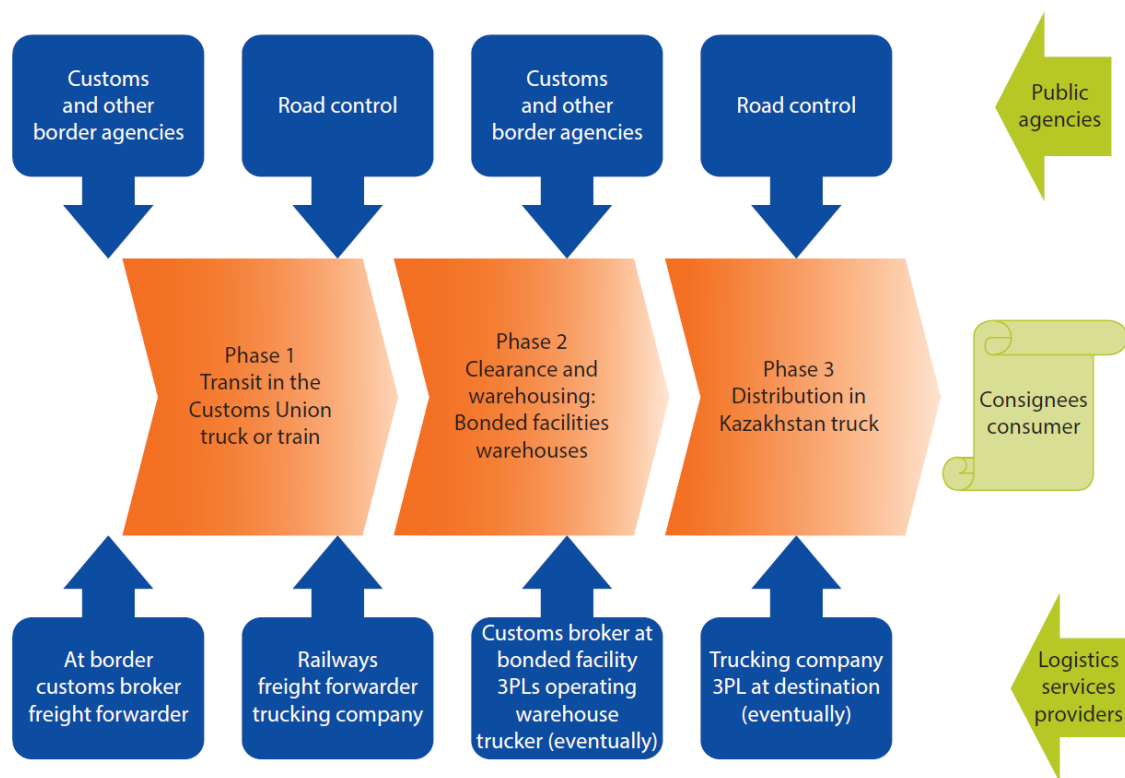

Figure *. Scheme of imports of goods to Kazakhstan

Source: Rastogi et al (2014)

All the phases of the scheme are more or less independent and the interests of different players overlap in a contradictory way while its implementation.

Non-physical barriers cause significant delays, increase transport and logistics costs, and have a negative impact on visibility and reliability in the transport chain. Traders, shippers, and transport operators face various non-physical barriers of different types and causes, one of the main - long waiting times and queues at border crossing points (BCP) or at en-route check points.

The cross-border control procedures used on particular trade lane, once acceptable, can become outdated and start creating problems if the competing route operator had introduced modern technologies saving time and money.

Most observers and market players argue that the major barriers for transport and trade in the EATL region manifest themselves at the Border crossing points (BCP).

Draft for information only

III.2. Border Crossing Points as bottlenecks

Several studies showed that border crossing times on EATL routes in Central Asia vary from a number of days to a few hours, but are on average too long compared to waiting times measured in other regions, such as South Asia and Europe [CAREC 2013, WP5 2015***].

A UNESCAP study on transit rail traffic in Asia and the Pacific point out that “average border-crossing times in Europe are in the 30-40 minutes range”, and that “the ECE recommendation for border stopping time is 60 minutes for international shuttle trains and 30 minutes for combined transport”.

Both transport modes, road and rail, are affected by the long delays at border crossings, but rail delays tend to be even longer than waiting times in road transport.

The ADB CCPMM data (CAREC 2013) allows a detailed comparison of waiting times in Central Asia at the level of individual border crossings. The report concludes that on a general level border crossing delays on CAREC corridors have not improved since 2009. Slight improvements can be observed for specific borders for road corridors, but rail transport border crossing times are still extremely high ranging from 65.6 hours at Dostyk (Kazakhstan) for cargo coming from China to the comparatively short times measured for the rail border crossing Alat-Farap between Uzbekistan and Turkmenistan where it takes only 6 hours to clear incoming cargo.

Figure ** and ** represent CCPMM data and show that times vary substantially from one border crossing to another.

Clearance time at the Kazakhstan-China border crossing Khorgos can take up to 28.2 hours for goods crossing into Kazakhstan and 11.2 hours for goods going into China. Clearance time for cargo at Tajik border points Dusti and Fatehobod with Afghanistan are, according to the CCPMM, amongst the lowest on the CAREC corridors (5.3 hours in Dusti and 5.1 hours in Fatehobod for incoming cargo). Waiting times at Uzbek border crossings range from 5.7 hours at the border with Kazakhstan in the North, Keles, to 9.7 hours at another border crossing with Kazakhstan further South, Yallama.

Border crossings waiting times and delays constitute a significant share of the overall travel time spent by trucks and trains on EATL routes and therefore have a strong negative impact on the attractiveness of the routes. A corridor analysis conducted by UNESCAP on the road route from Almaty (Kazakhstan) to Berlin (Germany) via the Russian Federation (Kulin and Krasnoe), Belarus, and Poland, revealed that 50 per cent of the transit time is spent waiting at border crossing points between Kazakhstan and the Russian Federation (3-4 days) and between the Russian Federation and Belarus (4-7 days). The overall time for the trip was 10-13 days, instead of the 6 days that were possible, if one assumes a border crossing time of 5 hours. [Informal document WP.5/GE.2, 2015 No 1].

Reliability factor. As it was mentioned above (see p*), one of the main requirements of supply chains is reliability and punctuality of services. In certain cases short lead time is not among the advantages of the certain route but logistic providers prefer this particular route because of its stable and predictable parameters.

As for many EATL transport links, especially related to the Central Asian area, stability and predictability of services are at poor level. Unpredictable delays, low degree of reliability, the unpredictability of services quality and price create severe disincentives to invest and increase total logistics costs.

Numerous surveys [**] indicate the following manifestations of this:

Transit time can vary dramatically. "Record" lead times look very attractive for shippers but the variations in everyday practice can be unacceptable for the market. Observers report the 40/90 days difference possible on certain routes

Shortages of rolling stock and equipment occur suddenly causing the delays. In some countries lack of rolling stock at harvest season is typical

Custom regulations, rail tariffs and road charges can change unexpectedly

Transit controls is implemented uniformly, irrespective of the principal's reliability and competence;

Convoy or escort systems are applied not only against risky cargo or insecure vessels (open trucks), but also on containers or sealed box wagons;

Obsolete freight transport rules and regulations

inadequate carnets and guarantee systems or the poor implementation of widespread transit systems like TIR

Additional charges and fees (often at regional level) can be introduced without warning

Railways can impose shipping bans to neighbor countries or to certain points for limited capacity reasons or to keep the rolling stock on national territory

regulatory barriers that impact the market structure and the quality of key support services (brokers, finance, insurance and other)

Simplified border procedures that are sometimes introduced are not practical because they require a declaration within hours of arrival - while arrival time is unpredictable.

Figure **. Average border crossing times, Uzbekistan road BSP, 2013

Fig. **. Average border crossing times for selected BCP, 2013

III.3. Barriers concerning goods transported

Customs procedures

Customs procedures are an obligatory process in all international road shipments involving border crossings and are the greatest cause of vehicle delays on delivery routes between Asia and Europe. Despite the World Customs Organization's International Convention on the Simplification and Harmonization of Customs Procedures (Revised Kyoto Convention) of 1999, the UN International Convention on the Harmonization of Frontier Controls of Goods of 1982 and the UN Customs Convention on the International Transport of Goods under cover of TIR Carnets (TIR Convention, 1975), customs regulations in practice continue to differ both in terms of requirements and procedures. In addition, there is no integrated information system or information exchange and, in a number of transit countries, customs posts are poorly equipped and employ out-of-date IT equipment that fails to provide data on cargo in a timely manner.

Export and import documents

The number of *export* documents varies enormously among EATL participating countries. Georgia, which requests exporters to prepare only four documents, is regarded as a regional best practice, particularly when compared to other EATL participating countries such as Tajikistan, which requests eleven documents. Afghanistan and Uzbekistan request ten, Belarus and Kazakhstan - nine, while Azerbaijan, China, Kyrgyzstan and the Russian Federation require their exporters to complete eight documents.

Good practice examples related to *import* documentation include Armenia requiring seven, Bulgaria six, China five, the Republic of Moldova seven and Georgia requiring only four import documents. In comparison, several other EATL countries require importers to complete up to ten documents: Afghanistan, Azerbaijan, Belarus and the Russian Federation. Kazakhstan requires its importers to complete twelve documents and Uzbekistan requires eleven import documents.

In addition to the above, EATL landlocked countries are presumed to need more days to export a container than countries with seaports: it takes on average 82 days to send an export from Tajikistan, 76 days to send an export from Kazakhstan, 74 days to send an export from Afghanistan and 71 and 63 days from Uzbekistan and the Kyrgyzstan, respectively. EATL best practice countries include Georgia with 10 days, Romania with 12 days, Armenia with 13 days and Turkey with 14 days. With regard to imports, best practices include Georgia and Romania with 13 days, Turkey with 15 days, and Bulgaria with 17 days leading the EATL region. The highest number of days required for handling and clearing imports are in Uzbekistan, 92 days, Tajikistan, 83 days, Afghanistan, 77 days and Kazakhstan, 62 days.

III.4. Barriers concerning border crossing technologies and procedures

BCP infrastructure problems

Inadequately designed border-crossing point infrastructure and equipment, as well as inadequate transport infrastructure connecting border-crossing points with transport networks, strictly speaking, have the physical character. But their impact of creating non-physical obstacles to international road and rail transport cannot be ignored.

Certain countries had designed and built their border-crossing points 20 years ago and these objects still do not have proper equipment. Some border-crossing point approach roads traverse the middle of villages, causing vehicle congestions. Often border crossings do not have enough lanes or windows to meet the peak transport flows.

Opportunities to improve transport links and border-crossing points exist, as per the infrastructure priority projects identified by EATL Phase I and Phase II Studies. Nevertheless, public and private stakeholders need more exposure to international best-practice transport, logistics and border-crossing point infrastructure design and management methods to realize the full benefits of investment in hard infrastructure, modern non-intrusive detection equipment and different ways to manage expensive border-crossing point assets.

BCP Process inefficiencies

Numerous government agencies are present at border crossings to control compliance with national legislation governing immigration, taxation, environment and health protection, customs and trade policy, transport services and vehicles, and other regulations. Control measures apply to drivers, means of transportation, and goods, and include document checks, weighing, scanning and measuring of vehicles, and physical inspection of the goods. These formalities take time, in particular if the multiple agencies involved do not collaborate and share documents, and information.

As many studies reveal, un-coordinated and repetitive intervention of numerous government agencies on the same shipment, high level of physical inspection of the cargo, and inadequate infrastructure and equipment characterize the border crossings in the region. The high frequency of physical inspection of shipments and cargo at border crossings seems to be the major bottleneck in the clearance processes.

As is reported, Kazakh customs authorities at the border crossing Khorgos, for example, do not trust cargo documents for mixed load containers coming in from China and therefore systematically physically inspect containers coming in from China to match the data with the actual goods. Customs authorities also commonly physically inspect the shipments or at least open the loading unit for primary visual inspection. Physical inspections do not only uphold the individual shipment in question but also lead to congestion, as many of the equipment and infrastructure at the border crossing do not match the growing cargo volumes and frequency of such operations.

There are many reasons for the persistence of physical inspection. Often there is no effective risk management system in place that allows the border staff to target their inspections on specific,

high and medium risk cargo and means of transportation, while clearing the other cargo and trucks faster without physical inspection.

Physical inspection is also an effective instrument for rent-seeking, as truck drivers and shippers want to speed up the process. Legislation may attribute a personal responsibility for non-detected fraud or smuggling to the border officials. Furthermore, numerous border crossing points lack equipment for non-intrusive controls, such as scanning or weighing of containers.

And finally, many of the border clearance process requirements are duplications: identical cargo and vehicle documents need to be presented, are reviewed and stamped by various agencies in a sequential process. Processes and document requirements are designed from the isolated point of view of each agency and are not optimized from the overall perspective of achieving a faster border crossing clearance through joint operations and sharing of data.

Draft for information only

III.5. Road transportation specific barriers

Bilateral and regional road transport agreements

Currently, the legal framework for undertaking international road cargo shipments between Asia and Europe is mainly based on bilateral intergovernmental agreements on international road transport. These govern the procedures and conditions for undertaking international shipments and contain provisions for preferential conditions, created for carriers on a mutual basis, as well as conditions for transborder access to markets, including stipulations for transit shipments. Following these bilateral agreements, national bodies issue a fixed number of permits, which grant the right to travel through the territories of the countries specified.

The transit countries, through which the Euro-Asian routes run have, currently have more than 140 bilateral agreements with countries in Europe and Asia, of which 75 govern transport between two transit states.

Although these bilateral agreements aim at “facilitating trade” and “balancing bilateral road transport markets” the bilateral nature of the conditions complicate the transport journey when several countries have to be crossed, or when vehicles and drivers come from different countries.

The most important “barrier issues” related to the above are the following:

- international bilateral agreements on road transport lay down differing legal conditions for undertaking cargo shipments between pairs of individual countries. This relates both to preferential conditions with regard to taxes and levies, as well as the existing procedures for issuing permits;
- specific routes and border crossings are fixed by some of the bilateral agreements and therewith limit the actual choice of transport routes for operators from foreign countries;
- the fact that quotas of permits issued have to be equally matched necessitates numerous rounds of negotiations, while the shortage of permits leads to significant delays incurred by hauliers before departing for an operation and/or at border crossings;
- the distribution of permits among carriers is linked in certain cases to corruption and discrimination towards individual hauliers;
- the procedures for agreeing and issuing permits are frequently too bureaucratic and not transparent;
- the permit schemes sometimes create complex formalities that lead to delays and discriminatory processes. For example, Chinese truck operators arriving at the Khorgos border crossing need to go to Almaty to obtain the permit;
- bilateral quotas are often too low, resulting in extremely high prices for road permits on occasion.

Driver’s visa formalities

Procedures related to visa issuance also have a strong negative impact on the shipment of cargo along EATL routes, due to the following issues:

- because of multiple border crossings along each proposed route, drivers will have to obtain visas for several transit countries;

- in a number of countries, drivers' visas are not issued at the border, but only at the Consular Sections of their embassies in the country of the driver's residence. This means that drivers are forced to temporarily relinquish their passport, which leads to loss of potential working hours. In addition, if the visa has to be processed *en route* in another transit state, further delays will occur. Kyrgyz, Tajik and Turkish hauliers, for example, are faced with this problem when travelling through Turkmenistan;

- the procedures for issuing visas are frequently discriminatory – given equal conditions, drivers from one country obtain visas quicker and with fewer formalities than drivers from other countries;

- the visa procedures in the transit countries are not synchronized (neither in the list of documents required, the charges nor the length of time required for processing).

- a number of countries do not offer long-term multi-entry visas.

- long processing times and high consular charges are a serious disincentive (for example an entry visa for Iran takes up to two weeks to process and a transit visa is issued for a maximum of 10 days).

It is reported by market players that drivers' visa formalities are sometimes used by national transport authorities as protectionist measures.

Arbitrary transit charges

High transit fees and restrictive permits for international road transport are constraining intra-Asian trade and trade with Europe. Road transit fees in certain countries in effect are charges on access to the market rather than charges for infrastructure use. They usually discriminate between operators from different countries, between permit and non-permit holders, and between domestic and foreign operators. The fees are often unclear and changed without notice.

III.6. Rail transportation specific barriers

Railway gauge change

Just as in case of road, barriers for rail transportation most often manifest themselves at the border crossing points. The “classic” problem for international rail transportation is the necessity to shift from one gauge to another at certain border points.

Most of the Western European EATL countries as well as China and Afghanistan use standard 1435 mm gauge. Former Soviet Union states and Finland use the “Russian” 1520 mm gauge. Therefore, some transfer operations are necessary. This is either the cargo transshipment between different types of railcars or (usually in case of passenger transportation) – change of bogies.

Trans-loading the wagons/containers and require specific facilities and equipment such as forklifts, cranes, etc. The equipment of the border crossing points is uneven. For example, Alashankou on the Chinese side has four trans-loading centers, each equipped with a crane that can handle 36 tons, but Dostyk on the Kazhak side, where goods are trans-loaded when travelling eastward, only has one trans-loading facility.

The time spent to change gauges sometimes causes significant delays. The situation worsens when there are not enough tracks for cargo transfer or when there is a long queue of trains during peak periods.

Railway system change

Even if the neighbor countries use one and the same railway gauge, the difference in railway systems lead to operations at the border. “Different railway systems” here means:

- technologies (electric power system, signaling and communication, rolling stock requirements, etc.)
- documentation (waybills, wagon lists, etc.);
- legal network accessibility for foreign locomotives/wagons/locomotive brigades;
- special requirements (for example, Chinese Railways place an armed officer on the train, which often causes delays).

Operations caused by these differences can include:

- documentary checks for matching between consignment notes, wagon lists, and cargo documents.
- classification and switching of wagons, forming the trains to carry the cargo transshipped at the border crossing point. Timely availability of rolling stock seems to be a cause of long waiting times, in particular when trains cross into Europe where different load and train length require the splitting of trains.
- exchange of locomotives and crews;

- rolling stock technical inspections;
- preparation of rail transfer documents.

Delays at border crossing range from 6,5 hours at Saryagash (Kazakhstan) to 42,7hours at Alashankou (China). The time required for break-of gauge operations ranges from 2,8 hours to 2,5hours, the classification of trains from 1,7hours to 1,2 hours, and the customs clearance from 3,7hours to 15,1hours.

Draft for information only

III.7. Intermodal transportation specific barriers

The main reported specific intermodal transportation problem on the EATL routes is the ferry crossings over the Caspian and Black Seas. Although the situation with the Black Sea ferry crossings is currently stable, the one in the Caspian Sea is significantly more complicated. Trucks travelling from Asia to Europe face delays due to the lack of ferry timing information, and because ferries are primarily geared to transport railway containers (railway companies are given preference on embarkation).

The small quota of ferry slots allocated to lorries leads to queues and lengthy delays in ports, made worse by the short validity period of Turkmen transit visas for drivers. In view of the latter, the development of intermodal transport linkages, coordinating road and maritime connections over the Caspian Sea, requires particular attention in the near future.

Draft for information ONLY

III.8. Political situation

“Political” issues can be divided into two segments: caused by international or domestic political conflicts and related to unclear or inconsistent transport and trade policy.

EATL trade and transport routes from time to time suffer from “high policies” instability. Political conflicts amongst EATL countries lead to permanent border closures. Such changes not only create disruptions but also increase uncertainty amongst the operators about the actual situation and reduce the efficiency in the transport chain as contingency times are frequently built into the schedules.

For example, the trade sanctions imposed by the EU-28 and Russia on specific goods had negatively influenced the trade and transport situation. There are reports that some transit cargo is refused to transit by the Federal Customs Service of the Russian Federation (FCS). Some market players are intending to ‘bypass’ the sanctions regime and design long, complicated and expensive logistics schemes.

In 2016 certain political groups blocked the transit roads in seven border regions of Ukraine stopping Russian trucks bound to Western Europe. Russia undertook the reciprocal measures; the incident damaged the trade badly.

The political instability of certain countries is an additional barrier to trade, and internal unrest has in certain cases resulted in periods of closed borders (as was the case in Kyrgyzstan). Border crossing point between Tajikistan and Kyrgyzstan have been closed frequently in 2013 and 2014 because of border incidents. Uzbekistan frequently closes its borders with Tajikistan in the Fergana valley for short periods, such as 10 days, for the festivities of the Independence Day.

Transport, trade and customs policies instability also is typical for the EATL region. Governments may change the classification of a border crossing points putting in place restrictions for cargo movement. The Kyrgyz Republic for example has re-classified the Karamyk border crossing with Tajikistan, so that transit cargo can officially no longer exit from there to Tajikistan. As Karamyk is an important crossing point for goods from China into Central Asia, the border crossing point is still used for transit cargo from China but truck drivers now have to add 100 km of to their travel route to drive to the next border post to get the exit stamp on the Customs declaration.

Many of the EATL countries are party to the TIR Convention that puts in place a common customs transit clearance procedure and a cross-border transit guarantee, the so-called TIR Carnets. The TIR Convention and its application by Customs authorities is crucial for Central Asia, Eastern European and Caucasus countries and is broadly believed to be well functioning and accepted by Customs authorities. In 2013 the Federal Russian Customs Office of Russia (FCS RF) had introduced the limitations for Carnet TIR procedures; additional securities for Carnet TIR holding transport are required. This decision did not only impose additional costs on international road traffic. The entire functioning of the TIR system had been put in doubt; a lot of concern, confusion and uncertainty with regards to the new procedure and the validity of the carnet is in place across the market.

III.9. Mismatch of public and private interests

The opinion reflected in several reports [*] based on field visits to border-crossing points and interviews with national and international exporting and importing companies is that the interests of private industry, government, transport and border-control agencies do not match.

The Ministries of Transport and border-control agencies are concerned with border-crossing security, safety and revenue collection issues; in certain cases, their concerns are addressed through a control approach that does not balance them with the needs for national trade facilitation. Sometimes they are not in the position to assist foreign operators and/or states who can benefit from fast and cheap transit.

On the other hand, private companies engaged in supply chains try to avoid delays in operations along their chosen supply routes, paying extra costs as a result. Their staff focuses efforts on tracking their shipments and search for expediting solutions by interfacing with government and border-crossing point officials. Some private companies do not expect policy, procedure and management change and continue to trade despite the challenges, passing on additional transaction costs to the consumer.

Draft for information only

IV. EATL: LOOKING INTO THE FUTURE

The initial SWOT-analysis of the EATL transport communications was developed during Phase II of the EATL-project to give the overall picture of a project. Results of SWOT analysis help to gain maximum benefits from strengths, outline the ways to compensate weaknesses, minimize threats and take the greatest possible advantage of opportunities.

The current section of the report contains the upgraded version of the SWOT analysis of the EATL project reflecting the changes and trends identified in the course of the project Phase III.

The following are considered to be EATL inland transport connection strengths:

EATL inland transport routes can often provide faster delivery than maritime routes for the transport of goods between the EU and the Asia-Pacific region.

EATL inland transport routes are an important transport option for EATL landlocked developing countries in the region for their access to international markets and their participation in globalization which means the constant objective attention to their development.

There are unutilized capacities along some parts of the EATL road and railway routes running East-West and North-South.

Some EATL routes are currently the preferred way for certain countries along the EATL to reach their major trade partners.

EATL routes are the integral part and physical extensions of the Trans-European Transport Networks, Pan-European Corridors, AGR, AGC, European Agreement on Important International Combined Transport Lines and Related Installations (AGTC), Asian Highway (AH) network, Trans-Asian Railway (TAR), Trans-European Motorway(TEM), Trans-European Railway (TER), TRACECA and other related corridors and networks of high significance for Europe and Asia. Thus their development is within the general trend of Eurasian trade facilitation supported by numerous international initiatives.

There is political commitment for the development of EATL inland transport routes expressed by concerned governments and various international and subregional organizations promoting related initiatives.

Local partnerships are being developed along the inland EATL routes among key players, including non-governmental organizations and bodies. In principle these partnerships

Since a good portion of EATL routes are in the planning and design phase, they can be constructed according to the best available technological and environmental standards and practice.

The following are considered to be general weaknesses observed on EATL inland transport links (not necessarily present in all the EATL countries):

The costs of goods transportation via inland EATL routes are generally too high compared to competing routes containing the maritime transport leg. The reason for that is not only the objective transport-economic factors but also the (sometimes) unreasonably high transit tariffs, fees and charges that pursue, primarily, the fiscal objectives;

The quality of transport and logistic services across the EATL corridors is rather low compared to that of maritime routes and usually does not match the market standards of developed countries;

Intermodal transportation is generally poorly developed across the EATL region, mainly in the Central-Asian part of it. There are relatively few intermodal services provided on the continental Euro-Asian market; intermodal logistic centers are rear on the transport infrastructure of the region;

Numerous physical and non-physical barriers along the inland EATL routes render transport operations difficult, costly, time-consuming, unpredictable and uncertain. These include, in particular:

inadequate, underdeveloped and poorly maintained road and rail networks with many bottlenecks and missing links on them;

cumbersome and inefficient control procedures leading to long delays at border crossing points;

multiple cargo checks *en route*, mandatory transit convoys, numerous agencies at borders requesting to approve documentation and numerous fiscal charges to be paid at certain points along the routes.

many border posts are poorly equipped and some are closed

transport restrictions, rules and procedures are frequently changed without notice.

The market institutions as well as the conditions for competitive business development are often underdeveloped in EATL countries, particularly:

market oriented railway reforms are not in place and many national railway systems are state-owned and keep their monopoly position. As a result rail rates are uncompetitive, inflexible and often contain hidden charges. The intentions of private operators to arrange competitive railway services often has no legal basis;

although many truck operators along EATL countries are now private, transport monopolies are still in place in some counties, operating under high tariffs and offering inadequate levels of service;

the institute of freight forwarders, cargo integrators, 3 PL providers and other market players facilitating trade and transportation is not adequately developed in many countries(as well as the legal base for their activities)

The level of international co-ordination and harmonization across the EATL routes is not high enough to provide smooth traffic of vehicles and goods. In particular:

there is no harmonized customs transit regime along all EATL routes;

international road permit quotas are in force along EATL, while the grant of visas to professional drivers is cumbersome and costly;

the heterogeneity of existing transport and transit rules and regulations along the inland EATL routes makes monitoring of the EATL corridors situation quite difficult

some regional transport initiatives are aimed at regional competition rather at co-operation within the EATL context;

intentions towards co-operative development of infrastructure are not adequately supported by mutual practical steps, in particular - investments

Widespread corruption along some EATL road routes not only forces international operators to make illegal payments but also makes officially declared procedures unreliable.

There are safety concerns along parts of the EATL road routes and international operators lack security.

Limited institutional and human resource capacities exist.

Generally low level of investment potential of many EATL countries is currently aggravated by the economic crisis that compels the governments to fulfil primarily urgent needs like health, housing, pensions, etc.

Due to low transport network development and insufficient amount of alternative routes (in comparison with the European region) one particular weak segment or missing link in one country can render a whole EATL route economically unviable for international transport.

The following are considered to be EATL inland transport connection opportunities:

In a long term, continuous globalization is expected to increase the transport of goods between Europe and Asia. The rapid growth of China and India generates greater transport demand and thus new opportunities for inland EATL routes.

Several events and trends are expected to promote the development of EATL routes, particularly:

The start of New Silk Way initiative

Creation of the Customs Union between the Russian Federation, Belarus and Kazakhstan

Accession of the Russian Federation (2012), Tajikistan (2013) and Kazakhstan (2015) to WTO;

Economic reforms in certain EATL countries improving the business climate

Developing trade among EATL countries, in particular between landlocked developing countries in Central Asia and their transit developing neighbors

Certain infrastructure projects are being implemented improving the transport-logistic network within the EATL area

A portion of “time-sensitive” transit can be redirected through inland EATL routes. Introduction of “slow steaming” on the maritime routes is expected to enlarge this segment

Further expansion of universal railway legal regime, in particular – enlarging coverage of the CIM/SMGS consignment note along EATL railway routes would facilitate rail EATL transport.

Railway reforms in certain EATL countries improve the environment for long-haul block-trains

Growing practical experience in long-haul container train operation

Best decisions and practices in facilitating border-crossing procedures are generalized, described and open to implementation

Increased efforts and progress in regional cooperation and integration among countries offer new opportunities to address existing challenges in a coordinated way.

The following are considered to be EATL inland transport connection threats:

The increasing trend of economic nationalism, persisting conflicts and political instability along some parts of EATL routes

The extremely low competitive transport costs of maritime routes that maintain them as the most attractive transport option for the majority of supply chains in Euro-Asian trade

Global warming and the expected opening of the Arctic North-West passage to container traffic may result in even more competitive maritime routes

Cost-reducing innovations in the air transport sector also offer challenges.

EATL Roadmap to 2030 (“Challenges – Opportunities – Solutions” matrix)

Scope: Next steps on EATL development. Road map on EATL development in the form of matrix: “Challenges – Opportunities – Solutions”. Special attention to: priority actions of the Vienna Program for landlocked countries (VPoA) and recommendations of the UN resolutions on transport and transit corridors.

This section describes proposed steps on national, regional and multilateral level aimed to further EATL development.

The main goal of Project Phase III is to identify the measures that will make the EATL overland links operational.

In fact, these links are already functioning accumulating the everyday experience of trade and transportation over the surface routes connecting Asia and Europe. In this way, the task is to generalize this experience and formulate the coordinated measures that will facilitate the further growth of EATL routes utilization.

Table * presents the *Challenges-Opportunities- Solutions* matrix for EATL area further development. Main project challenges are put together with the opportunities identified during the SWOT analysis.

The principle solutions indicated in the table are itemized below in the form of the recommendations in the following spheres:

- policies;
- facilitation, procedures, and institutions;
- infrastructure development.

Table *.Challenges-Opportunities- Solutions matrix for EATL area development

	Challenges		
Opportunities	POLICIES	FACILITATION, PROCEDURES AND INSTITUTIONS	INFRASTRUCTURE
In long-term perspective – increasing trade volumes between Europe and Asia. Actually developing trade between the EATL countries	Continue the activities within the EATL project in co-ordination with other similarly focused initiatives	Movement towards the universal legal regimes and administrative procedures across the Eurasian area based on best international practices	Eliminating bottlenecks and missing links on the potentially most effective overland transit routes and trade routes in the EATL area
Market-oriented economic reforms in certain EATL countries	Analyzing and dissemination of best decisions and models in the sphere of international trade and transport	Introduction of best international practices in new-adopted trade and transport legislation	Encouraging introduction of public-private –cooperation and other market-oriented forms of infrastructure projects financing
Increased efforts and progress in regional cooperation and integration. Development of series of regional initiatives and agreements. Further implementation of infrastructure projects in the EATL area	Improve the monitoring and high-level coordination of regional initiatives, programs and projects	Inter-harmonizing provisions of regional and bilateral agreements	Coordinating of infrastructure programs and projects. Developing the “system approach” to infrastructure programs developing the transport and logistic infrastructure in the interests of the entire economy
Growing practical experience in long-haul overland trade, in particular – in container train operation	Develop co-operation at the business level together with intergovernmental cooperation	Developing institutions and procedures facilitating the long-haul container trains operation and related activities	Advanced development of railway and logistic infrastructure providing effective container transportation
Relative growth of the “time-	Encouraging development of the freight-	Paying special attention to	Paying special attention to

sensitive” segment of cargo in the Eurasian trade	forwarding and high level logistic providers segment	procedures accelerating trade and transport operations	infrastructure projects providing time-effective transportation
Railway reforms in certain EATL countries. Expected expansion of universal railway legal regimes	Put railway reforms among highest policy priorities	Introduction of best international experience in newly adopted railway legislation	Introduction of effective mechanisms of railway infrastructure development in reform programs

Draft for information only

V. MAIN RECOMMENDATIONS

POLICIES

EATL seems to be the most comprehensive of all initiatives aimed at facilitation of trade and transportation across the Eurasian region. Thus it seems reasonable to continue the activities under the EATL “umbrella” in the format that will be found appropriate by the EATL countries

Continue the activities within the EATL project in co-ordination with other similarly focused initiatives

accede to relevant international, regional and subregional conventions and other legal instruments related to transit transport and trade facilitation

formulate national transport policies including transit and border crossing provisions with the participation of all relevant stakeholders

integrate EATL achievements in national transport plans and programs

Analyzing and dissemination of best decisions and models in the sphere of international trade and transport

carry out studies on transport-logistical competitiveness based on internationally recognized methodologies

promote policies helping national firms, especially small and medium-sized enterprises, to participate better in international trade and transport

simplify and synchronize visa issuing procedures, introduce long-term multi-entry visas where possible

Improve the high-level coordination and monitoring of regional initiatives, programs and projects

improve the monitoring of infrastructure developments, execution of transport facilitation plans, transport corridors functioning

improve collection and dissemination of transport and trade statistics and other relevant data

collaborate on prompt exchanging trade and transport data between the neighbor countries across the EATL routes

promote harmonization of regional policies, in particular – within regional initiatives and programs - so as to strengthen regional synergy, competitiveness and regional value chains

Support national transport and trade facilitation action plans and committees with participation of all the groups of stakeholders

develop the harmonized approach in trade and transport activities monitoring and forecasting to produce reliable commonly used forecasts

Develop co-operation at the administrative and business level together with intergovernmental cooperation

continue and enhance coordination and cooperation of national agencies and bodies responsible for all kinds of border and customs controls and procedures

promote involvement of transport business associations in public-private partnership, training and knowledge-exchange projects

establish or strengthen national committees on trade and transport facilitation, with the involvement of all relevant stakeholders

introduce the early-warning systems to inform the countries along transport corridors about the changes in the administrative regimes, charges, infrastructure restrictions, etc.

Encouraging development of the freight-forwarding and logistic providers segment

provide legal conditions for market competition development in the transport and logistic sector

undertake efforts to build human capacity in the logistic sector (training, educational programs, international exchange, etc.)

encourage establishing the associations and other non-governmental structures expressing the interests of market players involved in international trade and transportation

Put railway reforms among highest policy priorities

whatever model of the railway reform is used, monopolism in operations should not be in place in the industry

create the favorable conditions for independent national and foreign entities to undertake railway operations

provide the mechanisms for prompt changing railway tariffs according to the market situation

provide necessary market conditions in neighbor segments (e.g., in wagon manufacturing) to avoid lack of equipment and services used by railways

FACILITATION, PROCEDURES AND INSTITUTIONS

During the crisis times high-scale infrastructure investments seem to be a serious burden for many EATL countries. That is why institutional reforms and trade facilitation should be the leading priority in comparison with infrastructure projects

Movement towards the universal legal regimes and administrative procedures across the Eurasian area based on best international practices

standardize trade and transport documents

encourage shift to electronic documents

implement or scale up trade facilitation initiatives such as single-stop inspections, single windows for documentation, electronic payment, etc.

avoid fixing certain routes or border crossing points for international trade and traffic

avoid discrimination in visa regimes for drivers; offer long-term and multi-entry visas

avoid arbitrary derogations or limitations of international agreements concerning trade and transportation

use standardized practical tools to identify the obstacles to trade and transport flows, e.g. *the World Bank Trade and Transport Facilitation Assessment: A Practical Toolkit for Country Implementation*

Introduction of best international practices in new-adopted trade and transport legislation

gradually liberalize road transport services, taking into account specific circumstances in particular countries

introduce the rule of obligatory “early warning” about the changes in rules, tariffs, and procedures related to international trade and transport

provide special easy control procedures for market players with good reputation

limit compulsory convoy or escort by high risk commodities only

implement the best practices in using internationally adopted regimes and procedures like TIR

implement legislation allowing the operation of long-and-heavy road vehicles across the main trade corridors and in the hinterland of logistic centers

Inter-harmonizing provisions of regional and bilateral agreements

exchange information and experience of implementation of trade and transport agreements

promote multilateral and regional permit systems for road transport aimed to eliminate quantitative limits and focused on provision of quality and safety of road transport services

strive to avoid bilateral agreements when and where multilateral agreements exist

Developing institutions and procedures facilitating the long-haul container train operation and related activities

promote a better business environment so as to assist all the interested parties to organize and operate long-haul container trains

encourage the establishment of container pools across the overland operators

encourage organizing of training programs and inter-railway staff exchange programs

organize research work analyzing the successful cases and the failures in overland container train operations

introduce the simplified border procedures providing all the necessary conditions for their actual efficiency for market players

analyze the possibility of developing “Terminal services standard minimum” for use by the terminal staff across the EATL corridors - in a form of recommendations or “Best practices manual”

Paying special attention to procedures accelerating trade and transport operations

streamline and simplify border crossing procedures and practices and harmonize rules and regulations, including accession to relevant international conventions

identify non-physical barriers and evaluate their influence according to agreed common benchmarking procedures

use available customs transit systems (e.g. TIR) to expedite transport and transit operations

avoid maintaining, seeking or adopting any arrangements establishing quotas or other quantitative restrictions to international transportation

simplify visa requirements and formalities for personnel involved in international transportation

remove where possible additional internal checkpoints

record and analyze the reasons for border-crossing point congestion, queuing and time delays

develop and implement the system of border-crossing point Performance Indicators to benchmark the current situation and to evaluate the results of investment projects and changes in procedures

decrease the number of documents necessary for export or import procedures

introduce optimization of border crossing procedures on the basis of through joint operations and sharing of data

Introduction of best international experience in newly adopted railway legislation

follow the provisions of the Joint declaration expressing willingness to create a common legal regime for rail traffic across Asia and Europe of 2013

co-operate in the development of general conditions of transport for Euro-Asian rail transport(GTC EurAsia)

introduce the CIM-COTIF waybill as a transport document for international rail transportation

introduce competition within the railway sector using the most effective international models

envisage the legal conditions for the access of foreign rail operators to the national network, at least, in container train operations

INFRASTRUCTURE

To date, the EATL transport network has been very nearly formed and proved its efficiency for certain trade lanes and commodities. Numerous initiatives, programmes and projects are undertaken to improve the infrastructure in the EATL region. It seems

reasonable to focus the efforts on coordination, standardizing of infrastructure parameters and implementing the most effective “point-focused” projects

Eliminating bottlenecks and missing links on the potentially most effective overland transit routes and trade routes in the EATL area

Focus at identifying and remove obvious physical bottlenecks rather than at high-scale infrastructure projects

Road and rail transport should complement each other rather than compete in the Eurasian corridors

Logistic centers development in the nodes of the EATL corridors should be envisaged

Encourage the development of international logistic hubs

Encouraging introduction of public-private –cooperation and other market-oriented forms of infrastructure projects

develop the necessary policies and regulatory frameworks to promote private sector involvement in infrastructure development

promote enabling environment to attract foreign direct infrastructure investments

Coordinating of infrastructure programs and projects. Using the “system approach” to infrastructure programs developing the transport and logistic infrastructure in the interests of the entire economy

focus at developing the limited number of transport corridors across the national territory in order to gain the maximum efficiency and economies of scale

encourage creating transport-logistic and industrial clusters in order to fostering knowledge networks and links among companies

promote economies of scale for transport systems through intermodal transport development, creation of dry ports, logistic centers, etc.

provide development of sea ports coordinated with the development of port hinterland connections and the infrastructural objects located in the hinterland and directly linked to sea ports

motivate the developers and operators to co-operate in creation of high-scale multipurpose logistic sites serving domestic, international and transit trade and transportation

create logistic centers and dry ports as market-oriented nodes of supply chains improving the competitiveness of the entire EATL system

harmonize the axle limits along the main road routes to provide the effective road transportation

Further improve GIS applications and develop tools to support “smart” decisions in transportation and supply chains

Advanced development of railway and logistic infrastructure providing effective container transportation

encourage development of multi-purpose logistic centers with intermodal terminals

development of effective reloading capacities for containers and other intermodal units in the gauge-changing points

promote co-operation of railway and port authorities/operators in order to create effective railway intermodal terminals “on the quay” to ensure fast and cost-effective transshipment of containers

promote the cross-border cooperation of railway infrastructure administration to provide the harmonized technologies for container trains’ border crossing

replace the boogie change procedures for container trains to effective container transshipment

Paying special attention to infrastructure projects providing time-effective transportation

Ensure technical and operational interoperability of railway and road systems of neighbor countries

Develop project in sea ports aimed at improvement of sea-rail interoperability to ensure the synergy between the two modes

encourage harmonization of railway technological standards and road axle load limits to facilitate regional connectivity, where feasible

implement IT-systems to ensure transparency in border crossing procedures, customs and transit transport rules, regulations, fees and charges

upgrade border crossing point equipping them with modern surveillance methods for security (vehicle scanning equipment, etc.), as well as the necessary IT infrastructure and supportive systems

develop a Border-Crossing Point Design Guide for border crossing points of different types and scales based on BCP best-practice examples

Introduction of effective mechanisms of railway infrastructure development in reform programs

establishing the independent bodies responsible for infrastructure management and development

introduction of adequate infrastructure fees within the railway industry

encourage private participation in development and operation of certain infrastructure objects (terminals, railway logistic centers, railway sections built and operated by private companies)
