UNECE Working Party on Transport Statistics

Time series of OD matrices and travel time matrices based on FCD

Prof. Bert Leerkamp, Wuppertal University

Online, 15.06.2022

The project

Using FCD to estimate nationwide OD matrices

- of car and truck traffic
- based on NUTS3 areas (Germany and neighbours)
- for a time series 2017 2019 [trips/a]

Third step:

- ➔ Evaluation of methods and data: Is it possible to produce stable time series of nationwide OD matrices?
- → Measuring travel times in road networks (cars and trucks)

Data source

Floating Car Data (FCD) collected by German Automobile Club ADAC:

- covering Germany and neighboured countries
- primarily used to generate real time traffic flow information
- no data quality control regarding a representative sample (spatial, time-related, trip purpose-related) → "raw FCD"
- heterogeneous and changing data structure due to several different FCD providers (only cars/trucks, mixed vehicles)
- Per provider: different data transmitting frequencies (important f
 ür data interpretation)
- Data privacy: anonymisation of vehicle-ID every 24 h
- ➔ Influence of data sources on calculation of nationwide OD matrices
- → Outlook: Using Artificial Intelligence (AI) to forecast OD matrices

Some aspects of changing data sources:

- FCD data provider 44 appeared for the first time in data set 2018 and replaced provider 27 step by step
- FCD with v=0 km/h were originally deleted in data sets, but appeared temporarily in provider 27 data source
- Fluctuation in shares and spatial distribution of foreign cars
- → Evaluating representativeness of the complete data sets

	Change in data volume [%] 2017-2019		
Land	[%]	abs.	
Österreich	-298,8%	-347.006	
Belgien	-688,5%	-253.421	
Schweiz	-82,2%	513.093	
Tschechien	-742,5%	-151.348	
Deutschland	11,1%	44.359.238	
Dänemark	-350,7%	-29.144	
Frankreich	15,8%	1.962.408	
Kroatien	5,6%	116.408	
Italien	-147,5%	85.938	
Luxemburg	-347,9%	-36.812	
Niederlande	-400,4%	-191.454	
Polen	-30,9%	171.523	
Slowenien	-40,5%	20.361

Overview – comparison of matrices 2017/2018/2019

Jahrgang	2017	2018	2019
Anzahl unbesetzter Relationen	19.103	12.949	3.280
Anteil unbesetzter Relationen	11%	8%	2%

Declining number and share of ODrelations without trips due to rising data volume

Is 2% a realistic estimation for this item in population?

Jahrgang	2017	2018	2019
Gesamtfahrleistung aus FCD	653 Mrd. Fz-km	646 Mrd. Fz-km	657 Mrd. Fz-km

Total vehicle distance: declining (2018) and rising (2019) volume due to varying distance of trips inside the 9 distance classes which were used to expand the FCD trip sample

Merging FCD data bases of 2 or 3 years – better results?

Number of relations with 0 trips delines when merging FCD data sets.

Expanding the original FCD based trip matrix by using the number of inhabitants in starting zones (origin) leads to rising traffic attraction of destination zones, when FCD data sets of several years are merged.

Calculation of Travel Time Matrices – 2 methods

Trip based

OD matrix

Travel time per trip (several different routes)

Average/median travel time of all trips between 2 territorial units

Trajectory based

Road network, separated into ≈ 100 m sections (> 3 mio sections in nationwide network)

Routing: Find fastest route for all OD relations

Advantages of trajectory based method

- Travel time calculation is possible for arbitrary and even very small territorial units (NUTS3, LAU, grids)
- Much higher FCD sample on sections compared to sample of relations → travel time matrices can be generated for different time slots and day types (working day, sunday, ...)

≈ 440 NUTS3 (red) and> 11.000 LAU areas inGermany

Trip based and trajectory based calculation of travel time matrices

Differences in origin an destination coordinates

Trajectory based method allows to set the trip origin an ddestination coordinates, while trip based methed sets them in core area of starting/ending trips.

BERGISCHE UNIVERSITÄT 9 WUPPERTAL

Disadvantages:

High effort and complexity of map matching: It is not satisfactory to assign a FCD data spot to nearest road axis. Instead the assignment algorithm has to follow each data spot of a vehicle step by step. This causes long calculation times.

Implicit assumption of constant traffic flow quality during a complete trip doesn't fit for long trips (demand for dynamic routing)

bergische universität 10 wuppertal

Evaluation of accessibility:

Trajectory based method can generate travel times for an arbitrary amount of relations

This data set (speed related to direct distance) can be used to define levels of service of accessibility

→ Used for network planning

bergische universität **11** wuppertal

Use cases:

- Accessibility standards for transport networks (car and truck transport)
- Monitoring accessibility of central places, urban and rural regions
- Validation/calibration of network assignment models
- Calculating the effects of general speed limits on motorways (only Germany)

Thank You for Your Attention!

BERGISCHE UNIVERSITÄT WUPPERTAL

Challenges:

- ≈ 170.000 OD links in Germany (NUTS3 level)
- less than 10 trips/d on > 85% of all links
- no empirically proved "ground truth" about spatial distribution of trips
- FCD sample covers 1-2% of daily trips
- FCD sample 2017 > 12 billion data sets (developing fast algorithms)

Visualistion of German-wide OD matrix (NUTS3-level):

Intensity of color represents amount of trips
